

# §1.8-1.9: Linear Transformations

This week's goal is to think of the equation  $A\mathbf{x} = \mathbf{b}$  in terms of the “multiplication by  $A$ ” function: its input is  $\mathbf{x}$  and its output is  $\mathbf{b}$ .

Primary One:

$$2^2 = 4$$

$$3^2 = 9$$

Primary Four:

Think of this as:

$$\begin{array}{ccc} 2 & \xrightarrow{\quad\quad\quad} & 4 \\ 3 & \xrightarrow{\text{squaring}} & 9 \end{array}$$

Last week:

$$\begin{bmatrix} 8 & 3 & -4 \\ 5 & 1 & 2 \end{bmatrix} \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} = \begin{bmatrix} 10 \\ 9 \end{bmatrix}$$

$$\begin{bmatrix} 8 & 3 & -4 \\ 5 & 1 & 2 \end{bmatrix} \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} = \begin{bmatrix} 4 \\ 7 \end{bmatrix}$$

Today:

Think of this as:

$$\begin{array}{ccc} \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} & \xrightarrow{\text{multiply by } A} & \begin{bmatrix} 10 \\ 9 \end{bmatrix} \\ \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} & \xrightarrow{\text{multiply by } A} & \begin{bmatrix} 4 \\ 7 \end{bmatrix} \end{array}$$

Goal: think of the equation  $A\mathbf{x} = \mathbf{b}$  in terms of the “multiplication by  $A$ ” function: its input is  $\mathbf{x}$  and its output is  $\mathbf{b}$ .

In this class, we are interested in functions that are linear (see p6 for the definition).

Key skills:

- i Determine whether a function is linear (p7-9);  
(This involves the important mathematical skill of “axiom checking”, which also appears in other classes.)
- ii Find the standard matrix of a linear function (p12-13);
- iii Describe existence and uniqueness of solutions in terms of linear functions (p17-23).

**Definition:** A *function*  $f$  from  $\mathbb{R}^n$  to  $\mathbb{R}^m$  is a rule that assigns to each vector  $\mathbf{x}$  in  $\mathbb{R}^n$  a vector  $f(\mathbf{x})$  in  $\mathbb{R}^m$ . We write  $f : \mathbb{R}^n \rightarrow \mathbb{R}^m$ .

$\mathbb{R}^n$  is the *domain* of  $f$ .

$\mathbb{R}^m$  is the *codomain* of  $f$ .

$f(x)$  is the *image of  $x$  under  $f$* .

The *range* is the set of all images. It is a subset of the codomain.

**Example:**  $f : \mathbb{R} \rightarrow \mathbb{R}$  given by  $f(x) = x^2$ .

Its domain = codomain =  $\mathbb{R}$ , its range = {zero and positive numbers}.

## Examples:

$$f : \mathbb{R}^2 \rightarrow \mathbb{R}^3, \text{ defined by } f \left( \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \right) = \begin{bmatrix} x_2^3 \\ 2x_1 + x_2 \\ 0 \end{bmatrix}.$$

The range of  $f$  is the plane  $z = 0$  (it is obvious that the range must be a subset of the plane  $z = 0$ , and with a bit of work (see p18), we can show that all points in  $\mathbb{R}^3$  with  $z = 0$  is the image of some point in  $\mathbb{R}^2$  under  $f$ ).

$$h : \mathbb{R}^3 \rightarrow \mathbb{R}^2, \text{ given by the matrix transformation } h(\mathbf{x}) = \begin{bmatrix} 8 & 3 & -4 \\ 5 & 1 & 2 \end{bmatrix} \mathbf{x}.$$

## Geometric Examples:

$g : \mathbb{R}^2 \rightarrow \mathbb{R}^2$ , given by reflection through the  $x_2$ -axis.

$$g \left( \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \right) = \begin{bmatrix} -x_1 \\ x_2 \end{bmatrix}.$$

$S : \mathbb{R}^2 \rightarrow \mathbb{R}^2$ , given by **dilation** by a factor of 3.

$$S(\mathbf{x}) = 3\mathbf{x}.$$

In this class, we will concentrate on functions that are **linear**. (For historical reasons, people like to say “linear transformation” instead of “linear function”.)

**Definition:** A function  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is a **linear transformation** if:

1.  $T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$  for all  $\mathbf{u}, \mathbf{v}$  in the domain of  $T$ ;
2.  $T(c\mathbf{u}) = cT(\mathbf{u})$  for all scalars  $c$  and for all  $\mathbf{u}$  in the domain of  $T$ .

For your intuition: the name “linear” is because these functions preserve lines: A line through the point  $\mathbf{p}$  in the direction  $\mathbf{v}$  is the set  $\mathbf{p} + s\mathbf{v}$ , where  $s$  is any number. If  $T$  is linear, then the image of this set is

$$T(\mathbf{p} + s\mathbf{v}) \stackrel{1}{=} T(\mathbf{p}) + T(s\mathbf{v}) \stackrel{2}{=} T(\mathbf{p}) + sT(\mathbf{v}),$$

the line through the point  $T(\mathbf{p})$  in the direction  $T(\mathbf{v})$ .  
(If  $T(\mathbf{v}) = \mathbf{0}$ , then the image is just the point  $T(\mathbf{p})$ .)

In this class, we will concentrate on functions that are **linear**. (For historical reasons, people like to say “linear transformation” instead of “linear function”.)

**Definition:** A function  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is a **linear transformation** if:

1.  $T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$  for all  $\mathbf{u}, \mathbf{v}$  in the domain of  $T$ ;
2.  $T(c\mathbf{u}) = cT(\mathbf{u})$  for all scalars  $c$  and for all  $\mathbf{u}$  in the domain of  $T$ .

For your intuition: the name “linear” is because these functions preserve lines: A line through the point  $\mathbf{p}$  in the direction  $\mathbf{v}$  is the set  $\mathbf{p} + s\mathbf{v}$ , where  $s$  is any number. If  $T$  is linear, then the image of this set is

$$T(\mathbf{p} + s\mathbf{v}) \stackrel{1}{=} T(\mathbf{p}) + T(s\mathbf{v}) \stackrel{2}{=} T(\mathbf{p}) + sT(\mathbf{v}),$$

the line through the point  $T(\mathbf{p})$  in the direction  $T(\mathbf{v})$ .  
(If  $T(\mathbf{v}) = \mathbf{0}$ , then the image is just the point  $T(\mathbf{p})$ .)

**Fact:** A linear transformation  $T$  must satisfy  $T(\mathbf{0}) = \mathbf{0}$ .

**Proof:** Put  $c = 0$  in condition 2.

**Definition:** A function  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is a **linear transformation** if:

1.  $T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$  for all  $\mathbf{u}, \mathbf{v}$  in the domain of  $T$ ;
2.  $T(c\mathbf{u}) = cT(\mathbf{u})$  for all scalars  $c$  and all  $\mathbf{u}$ , in the domain of  $T$ .

**Example:** Is  $f\left(\begin{bmatrix} x_1 \\ x_2 \end{bmatrix}\right) = \begin{bmatrix} x_2^3 \\ 2x_1 + x_2 \\ 0 \end{bmatrix}$  linear?

**Definition:** A function  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is a **linear transformation** if:

1.  $T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$  for all  $\mathbf{u}, \mathbf{v}$  in the domain of  $T$ ;
2.  $T(c\mathbf{u}) = cT(\mathbf{u})$  for all scalars  $c$  and all  $\mathbf{u}$ , in the domain of  $T$ .

**Example:**  $f\left(\begin{bmatrix} x_1 \\ x_2 \end{bmatrix}\right) = \begin{bmatrix} x_2^3 \\ 2x_1 + x_2 \\ 0 \end{bmatrix}$  is not linear:

Take  $\mathbf{u} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$  and  $c = 2$ :

$$f\left(2 \begin{bmatrix} 1 \\ 1 \end{bmatrix}\right) = f\left(\begin{bmatrix} 2 \\ 2 \end{bmatrix}\right) = \begin{bmatrix} 8 \\ 6 \\ 0 \end{bmatrix}.$$

$$2f\left(\begin{bmatrix} 1 \\ 1 \end{bmatrix}\right) = 2 \begin{bmatrix} 1 \\ 3 \\ 0 \end{bmatrix} = \begin{bmatrix} 2 \\ 6 \\ 0 \end{bmatrix} \neq \begin{bmatrix} 8 \\ 6 \\ 0 \end{bmatrix}.$$

So condition 2 is false for  $f$ .

Exercise: find a  $\mathbf{u}$  and a  $\mathbf{v}$  to show that condition 1 is also false.

**Definition:** A function  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is a **linear transformation** if:

1.  $T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$  for all  $\mathbf{u}, \mathbf{v}$  in the domain of  $T$ ;
2.  $T(c\mathbf{u}) = cT(\mathbf{u})$  for all scalars  $c$  and all  $\mathbf{u}$ , in the domain of  $T$ .

**Example:**  $g \left( \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \right) = \begin{bmatrix} -x_1 \\ x_2 \end{bmatrix}$  (reflection through the  $x_2$ -axis) is linear:

$$1. \quad g \left( \begin{bmatrix} u_1 + v_1 \\ u_2 + v_2 \end{bmatrix} \right) = \begin{bmatrix} -(u_1 + v_1) \\ u_2 + v_2 \end{bmatrix} = \begin{bmatrix} -u_1 \\ u_2 \end{bmatrix} + \begin{bmatrix} -v_1 \\ v_2 \end{bmatrix} = g \left( \begin{bmatrix} u_1 \\ u_2 \end{bmatrix} \right) + g \left( \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} \right).$$

$$2. \quad g \left( \begin{bmatrix} cu_1 \\ cu_2 \end{bmatrix} \right) = \begin{bmatrix} -cu_1 \\ cu_2 \end{bmatrix} = c \begin{bmatrix} -u_1 \\ u_2 \end{bmatrix} = cg \left( \begin{bmatrix} u_1 \\ u_2 \end{bmatrix} \right).$$

**Definition:** A function  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is a **linear transformation** if:

1.  $T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$  for all  $\mathbf{u}, \mathbf{v}$  in the domain of  $T$ ;
2.  $T(c\mathbf{u}) = cT(\mathbf{u})$  for all scalars  $c$  and all  $\mathbf{u}$ , in the domain of  $T$ .

**Example:**  $g \left( \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \right) = \begin{bmatrix} -x_1 \\ x_2 \end{bmatrix}$  (reflection through the  $x_2$ -axis) is linear:

$$1. \quad g \left( \begin{bmatrix} u_1 + v_1 \\ u_2 + v_2 \end{bmatrix} \right) = \begin{bmatrix} -(u_1 + v_1) \\ u_2 + v_2 \end{bmatrix} = \begin{bmatrix} -u_1 \\ u_2 \end{bmatrix} + \begin{bmatrix} -v_1 \\ v_2 \end{bmatrix} = g \left( \begin{bmatrix} u_1 \\ u_2 \end{bmatrix} \right) + g \left( \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} \right).$$

$$2. \quad g \left( \begin{bmatrix} cu_1 \\ cu_2 \end{bmatrix} \right) = \begin{bmatrix} -cu_1 \\ cu_2 \end{bmatrix} = c \begin{bmatrix} -u_1 \\ u_2 \end{bmatrix} = cg \left( \begin{bmatrix} u_1 \\ u_2 \end{bmatrix} \right).$$

Notice from the previous two examples:

To show that a function is linear, check **both** conditions for **general**  $\mathbf{u}, \mathbf{v}, c$  (i.e. use variables).

To show that a function is **not** linear, show that **one** of the conditions is not satisfied for a **particular numerical values** of  $\mathbf{u}$  and  $\mathbf{v}$  (for 1) or of  $c$  and  $\mathbf{u}$  (for 2).

**Definition:** A function  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is a **linear transformation** if:

1.  $T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$  for all  $\mathbf{u}, \mathbf{v}$  in the domain of  $T$ ;
2.  $T(c\mathbf{u}) = cT(\mathbf{u})$  for all scalars  $c$  and all  $\mathbf{u}$ , in the domain of  $T$ .

For simple functions, we can combine the two conditions at the same time, and check just one statement:  $T(c\mathbf{u} + d\mathbf{v}) = cT(\mathbf{u}) + dT(\mathbf{v})$ , for all scalars  $c, d$  and all vectors  $\mathbf{u}, \mathbf{v}$ . (Condition 1 is the case  $c = d = 1$ , condition 2 is the case  $d = 0$ . Exercise: show that if  $T$  satisfies conditions 1 and 2, then  $T$  satisfies the combined condition.)

Notice from the previous two examples:

To show that a function is linear, check **both** conditions for **general**  $\mathbf{u}, \mathbf{v}, c$  (i.e. use variables).

To show that a function is **not** linear, show that **one** of the conditions is not satisfied for a **particular numerical values** of  $\mathbf{u}$  and  $\mathbf{v}$  (for 1) or of  $c$  and  $\mathbf{u}$  (for 2).

**Definition:** A function  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is a **linear transformation** if:

1.  $T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$  for all  $\mathbf{u}, \mathbf{v}$  in the domain of  $T$ ;
2.  $T(c\mathbf{u}) = cT(\mathbf{u})$  for all scalars  $c$  and all  $\mathbf{u}$ , in the domain of  $T$ .

For simple functions, we can combine the two conditions at the same time, and check just one statement:  $T(c\mathbf{u} + d\mathbf{v}) = cT(\mathbf{u}) + dT(\mathbf{v})$ , for all scalars  $c, d$  and all vectors  $\mathbf{u}, \mathbf{v}$ . (Condition 1 is the case  $c = d = 1$ , condition 2 is the case  $d = 0$ . Exercise: show that if  $T$  satisfies conditions 1 and 2, then  $T$  satisfies the combined condition.)

**Example:**  $S(\mathbf{x}) = 3\mathbf{x}$  (dilation by a factor of 3) is linear:

$$S(c\mathbf{u} + d\mathbf{v}) = 3(c\mathbf{u} + d\mathbf{v}) = 3c\mathbf{u} + 3d\mathbf{v} = cS(\mathbf{u}) + dS(\mathbf{v}).$$

**Definition:** A function  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is a **linear transformation** if:

1.  $T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$  for all  $\mathbf{u}, \mathbf{v}$  in the domain of  $T$ ;
2.  $T(c\mathbf{u}) = cT(\mathbf{u})$  for all scalars  $c$  and all  $\mathbf{u}$ , in the domain of  $T$ .

For simple functions, we can combine the two conditions at the same time, and check just one statement:  $T(c\mathbf{u} + d\mathbf{v}) = cT(\mathbf{u}) + dT(\mathbf{v})$ , for all scalars  $c, d$  and all vectors  $\mathbf{u}, \mathbf{v}$ . (Condition 1 is the case  $c = d = 1$ , condition 2 is the case  $d = 0$ . Exercise: show that if  $T$  satisfies conditions 1 and 2, then  $T$  satisfies the combined condition.)

**Example:**  $S(\mathbf{x}) = 3\mathbf{x}$  (dilation by a factor of 3) is linear:

$$S(c\mathbf{u} + d\mathbf{v}) = 3(c\mathbf{u} + d\mathbf{v}) = 3c\mathbf{u} + 3d\mathbf{v} = cS(\mathbf{u}) + dS(\mathbf{v}).$$

**Important Example:** All **matrix transformations**  $T(\mathbf{x}) = A\mathbf{x}$  are **linear**:

$$T(c\mathbf{u} + d\mathbf{v}) = A(c\mathbf{u} + d\mathbf{v}) = A(c\mathbf{u}) + A(d\mathbf{v}) = cA\mathbf{u} + dA\mathbf{v} = cT(\mathbf{u}) + dT(\mathbf{v}).$$

In general:

Write  $\mathbf{e}_i$  for the vector with 1 in row  $i$  and 0 in all other rows.

(So  $\mathbf{e}_i$  means a different thing depending on which  $\mathbb{R}^n$  we are working in.)

For example, in  $\mathbb{R}^3$ , we have  $\mathbf{e}_1 = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$ ,  $\mathbf{e}_2 = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$ ,  $\mathbf{e}_3 = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$ .

$\{\mathbf{e}_1, \dots, \mathbf{e}_n\}$  span  $\mathbb{R}^n$ , and  $\mathbf{x} = \begin{bmatrix} x_1 \\ \vdots \\ x_n \end{bmatrix} = x_1 \mathbf{e}_1 + \dots + x_n \mathbf{e}_n$ .

So, if  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is a linear transformation, then

$$T(\mathbf{x}) = T(x_1 \mathbf{e}_1 + \dots + x_n \mathbf{e}_n) = x_1 T(\mathbf{e}_1) + \dots + x_n T(\mathbf{e}_n) = \begin{bmatrix} | & & | \\ T(\mathbf{e}_1) & \dots & T(\mathbf{e}_n) \\ | & & | \end{bmatrix} \begin{bmatrix} x_1 \\ \vdots \\ x_n \end{bmatrix}.$$

**Theorem 10: The matrix of a linear transformation:** Every linear transformation  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is a matrix transformation:  $T(\mathbf{x}) = A\mathbf{x}$  where  $A$  is the *standard matrix for  $T$* , the  $m \times n$  matrix given by

$$A = \begin{bmatrix} | & & | \\ T(\mathbf{e}_1) & \dots & T(\mathbf{e}_n) \\ | & & | \end{bmatrix}.$$

We can think of the standard matrix as a compact way of storing the information about  $T$ .

**Example:**  $S : \mathbb{R}^2 \rightarrow \mathbb{R}^2$ , given by *dilation* by a factor of 3,  $S(\mathbf{x}) = 3\mathbf{x}$ .

$$S(\mathbf{e}_1) = S\left(\begin{bmatrix} 1 \\ 0 \end{bmatrix}\right) = 3\left(\begin{bmatrix} 1 \\ 0 \end{bmatrix}\right) = \begin{bmatrix} 3 \\ 0 \end{bmatrix}, \quad S(\mathbf{e}_2) = S\left(\begin{bmatrix} 0 \\ 1 \end{bmatrix}\right) = 3\left(\begin{bmatrix} 0 \\ 1 \end{bmatrix}\right) = \begin{bmatrix} 0 \\ 3 \end{bmatrix}.$$

So the standard matrix of  $S$  is  $\begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix}$ , i.e.  $S(\mathbf{x}) = \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix} \mathbf{x}$ .

**Example:**  $g \left( \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \right) = \begin{bmatrix} -x_1 \\ x_2 \end{bmatrix}$  (reflection through the  $x_2$ -axis):

The standard matrix of  $g$  is  $\begin{bmatrix} | & | \\ g(\mathbf{e}_1) & g(\mathbf{e}_2) \\ | & | \end{bmatrix} = \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix}$ .

Indeed,  $\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} -x_1 \\ x_2 \end{bmatrix}$ .

Now we rephrase our existence and uniqueness questions in terms of functions.

**Definition:** A function  $f : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is *onto* (surjective) if each  $\mathbf{y}$  in  $\mathbb{R}^m$  is the image of *at least one*  $\mathbf{x}$  in  $\mathbb{R}^n$ .

Other ways of saying this:

- The range is all of the codomain  $\mathbb{R}^m$ ,
- The equation  $f(\mathbf{x}) = \mathbf{y}$  has a solution for every  $\mathbf{y}$  in  $\mathbb{R}^m$ .

**Definition:** A function  $f : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is *one-to-one* (injective) if each  $\mathbf{y}$  in  $\mathbb{R}^m$  is the image of *at most one*  $\mathbf{x}$  in  $\mathbb{R}^n$ .

Other ways of saying this:

- ??? (something that only works for linear transformations, see p20),
- The equation  $f(\mathbf{x}) = \mathbf{y}$  has no solutions or a unique solution.

**Definition:** A function  $f : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is *onto* (surjective) if each  $\mathbf{y}$  in  $\mathbb{R}^m$  is the image of *at least one*  $\mathbf{x}$  in  $\mathbb{R}^n$ .

**Definition:** A function  $f : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is *one-to-one* (injective) if each  $\mathbf{y}$  in  $\mathbb{R}^m$  is the image of *at most one*  $\mathbf{x}$  in  $\mathbb{R}^n$ .

**Example:**  $f : \mathbb{R}^2 \rightarrow \mathbb{R}^3$ , defined by  $f \left( \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \right) = \begin{bmatrix} x_2^3 \\ 2x_1 + x_2 \\ 0 \end{bmatrix}$ .

Is  $f$  onto? Is  $f$  one-to-one?

**Definition:** A function  $f : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is *onto* (surjective) if each  $\mathbf{y}$  in  $\mathbb{R}^m$  is the image of *at least one*  $\mathbf{x}$  in  $\mathbb{R}^n$ .

**Definition:** A function  $f : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is *one-to-one* (injective) if each  $\mathbf{y}$  in  $\mathbb{R}^m$  is the image of *at most one*  $\mathbf{x}$  in  $\mathbb{R}^n$ .

**Example:**  $f : \mathbb{R}^2 \rightarrow \mathbb{R}^3$ , defined by  $f \left( \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \right) = \begin{bmatrix} x_2^3 \\ 2x_1 + x_2 \\ 0 \end{bmatrix}$ .

$f$  is not onto, because  $f(\mathbf{x}) = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$  does not have a solution.

$f$  is one-to-one: the solution to  $f(\mathbf{x}) = \begin{bmatrix} y_1 \\ y_2 \\ 0 \end{bmatrix}$  is  $x_2 = \sqrt[3]{y_1}$ ,  $x_1 = \frac{1}{2}(y_2 - x_2) = \frac{1}{2}(y_2 - \sqrt[3]{y_1})$

and  $f(\mathbf{x}) = \begin{bmatrix} y_1 \\ y_2 \\ y_3 \end{bmatrix}$  does not have a solution if  $y_3 \neq 0$ .

There is an easier way to check if a linear transformation is one-to-one:

**Definition:** The *kernel* of a linear transformation  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is the set of solutions to  $T(\mathbf{x}) = \mathbf{0}$ .

Or, in set notation:  $\ker T = \{\mathbf{x} \in \mathbb{R}^n \mid T(\mathbf{x}) = \mathbf{0}\}$ .

**Fact:** If  $T(\mathbf{v}_1) = T(\mathbf{v}_2)$ , then  $\mathbf{v}_1 - \mathbf{v}_2$  is in the kernel of  $T$ .

**Example:** Let  $T$  be projection onto the  $x_1$ -axis.

The kernel of  $T$  is

There is an easier way to check if a linear transformation is one-to-one:

**Definition:** The *kernel* of a linear transformation  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is the set of solutions to  $T(\mathbf{x}) = \mathbf{0}$ .

Or, in set notation:  $\ker T = \{\mathbf{x} \in \mathbb{R}^n \mid T(\mathbf{x}) = \mathbf{0}\}$ .

**Fact:** If  $T(\mathbf{v}_1) = T(\mathbf{v}_2)$ , then  $\mathbf{v}_1 - \mathbf{v}_2$  is in the kernel of  $T$ .

**Example:** Let  $T$  be projection onto the  $x_1$ -axis.

The kernel of  $T$  is the  $x_2$ -axis.

$$T\left(\begin{bmatrix} 2 \\ 2 \end{bmatrix}\right) = T\left(\begin{bmatrix} 2 \\ 1 \end{bmatrix}\right) = \begin{bmatrix} 2 \\ 0 \end{bmatrix}.$$

$$\begin{bmatrix} 2 \\ 2 \end{bmatrix} - \begin{bmatrix} 2 \\ 1 \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \end{bmatrix}, \text{ which is in the kernel.}$$

$$\bullet \begin{bmatrix} 2 \\ 2 \end{bmatrix}$$

$$\bullet \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

Proof of Fact: If  $T(\mathbf{v}_1) = T(\mathbf{v}_2) = \mathbf{y}$ , then  $T(\mathbf{v}_1 - \mathbf{v}_2) = T(\mathbf{v}_1) - T(\mathbf{v}_2) = \mathbf{y} - \mathbf{y} = \mathbf{0}$ .

There is an easier way to check if a linear transformation is one-to-one:

**Definition:** The *kernel* of a linear transformation  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is the set of solutions to  $T(\mathbf{x}) = \mathbf{0}$ .

**Fact:** If  $T(\mathbf{v}_1) = T(\mathbf{v}_2)$ , then  $\mathbf{v}_1 - \mathbf{v}_2$  is in the kernel of  $T$ .

**Theorem:** A linear transformation is *one-to-one* if and only if its *kernel* is  $\{\mathbf{0}\}$ .

Warning: this only works for linear transformations. For other functions, the solution sets of  $f(\mathbf{x}) = \mathbf{y}$  and  $f(\mathbf{x}) = \mathbf{0}$  are not related.

There is an easier way to check if a linear transformation is one-to-one:

**Definition:** The *kernel* of a linear transformation  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is the set of solutions to  $T(\mathbf{x}) = \mathbf{0}$ .

**Fact:** If  $T(\mathbf{v}_1) = T(\mathbf{v}_2)$ , then  $\mathbf{v}_1 - \mathbf{v}_2$  is in the kernel of  $T$ .

**Theorem:** A linear transformation is *one-to-one* if and only if its *kernel* is  $\{\mathbf{0}\}$ .

Warning: this only works for linear transformations. For other functions, the solution sets of  $f(\mathbf{x}) = \mathbf{y}$  and  $f(\mathbf{x}) = \mathbf{0}$  are not related.

**Proof:**

Suppose  $T$  is one-to-one. Taking  $\mathbf{y} = \mathbf{0}$  in the definition of one-to-one shows  $T(\mathbf{x}) = \mathbf{0}$  has at most one solution. Since  $\mathbf{0}$  is a solution, it must be the only one. So its kernel is  $\{\mathbf{0}\}$ .

Suppose the kernel of  $T$  is  $\{\mathbf{0}\}$ . Then, from the Fact, if there are vectors  $\mathbf{v}_1, \mathbf{v}_2$  with  $T(\mathbf{v}_1) = T(\mathbf{v}_2) = \mathbf{y}$ , then  $\mathbf{v}_1 - \mathbf{v}_2 = \mathbf{0}$ , i.e.  $\mathbf{v}_1 = \mathbf{v}_2$ .

**Definition:** The *kernel* of a linear transformation  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is the set of solutions to  $T(\mathbf{x}) = \mathbf{0}$ .

**Theorem:** A linear transformation is *one-to-one* if and only if its *kernel* is  $\{\mathbf{0}\}$ .

So a matrix transformation  $\mathbf{x} \mapsto A\mathbf{x}$  is one-to-one if and only if the set of solutions to  $A\mathbf{x} = \mathbf{0}$  is  $\{\mathbf{0}\}$ . This is equivalent to many other things:

**Definition:** The *kernel* of a linear transformation  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is the set of solutions to  $T(\mathbf{x}) = \mathbf{0}$ .

**Theorem:** A linear transformation is *one-to-one* if and only if its *kernel* is  $\{\mathbf{0}\}$ .

So a matrix transformation  $\mathbf{x} \mapsto A\mathbf{x}$  is one-to-one if and only if the set of solutions to  $A\mathbf{x} = \mathbf{0}$  is  $\{\mathbf{0}\}$ . This is equivalent to many other things:

**Theorem: Uniqueness of solutions to linear systems:** For a matrix  $A$ , the following are equivalent:

- a.  $A\mathbf{x} = \mathbf{0}$  has no non-trivial solution.
- b. If  $A\mathbf{x} = \mathbf{b}$  is consistent, then it has a unique solution.
- c. The columns of  $A$  are linearly independent.
- d.  $\text{rref}(A)$  has a pivot in every column (i.e. all variables are basic).
- e. The linear transformation  $\mathbf{x} \mapsto A\mathbf{x}$  is one-to-one.
- f. The kernel of the linear transformation  $\mathbf{x} \mapsto A\mathbf{x}$  is  $\{\mathbf{0}\}$ .

(In fact, the first theorem above is the equivalence of b. and a. in the language of linear transformations instead of matrices.)

Now let's think about onto and existence of solutions.

Recall that the range of a linear transformation  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is the set of images, i.e. the set of  $\mathbf{y}$  in  $\mathbb{R}^m$  with  $T(\mathbf{x}) = \mathbf{y}$  for some  $\mathbf{x}$  in  $\mathbb{R}^n$ .

So, the range of the linear transformation  $\mathbf{x} \mapsto A\mathbf{x}$  is the set of  $\mathbf{b}$  for which  $A\mathbf{x} = \mathbf{b}$  has a solution.

Now let's think about onto and existence of solutions.

Recall that the range of a linear transformation  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is the set of images, i.e. the set of  $\mathbf{y}$  in  $\mathbb{R}^m$  with  $T(\mathbf{x}) = \mathbf{y}$  for some  $\mathbf{x}$  in  $\mathbb{R}^n$ .

So, the range of the linear transformation  $\mathbf{x} \mapsto A\mathbf{x}$  is the set of  $\mathbf{b}$  for which  $A\mathbf{x} = \mathbf{b}$  has a solution.

So the **range** of  $T$  is the **span of the columns** of  $A$  (see week 2 p17).

**Example:** The standard matrix of projection onto the  $x_1$ -axis is  $\begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}$ .

Its range is the  $x_1$ -axis, which is also  $\text{Span} \left\{ \begin{bmatrix} 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 0 \end{bmatrix} \right\}$

The range of the linear transformation  $\mathbf{x} \mapsto A\mathbf{x}$  is the set of  $\mathbf{b}$  for which  $A\mathbf{x} = \mathbf{b}$  has a solution.

And a linear transformation  $\mathbb{R}^n \rightarrow \mathbb{R}^m$  is onto if and only if its range is all of  $\mathbb{R}^m$ .  
Putting these together:  $\mathbf{x} \mapsto A\mathbf{x}$  is onto if and only if  $A\mathbf{x} = \mathbf{b}$  is always consistent, and this is equivalent to many things:

The range of the linear transformation  $\mathbf{x} \mapsto A\mathbf{x}$  is the set of  $\mathbf{b}$  for which  $A\mathbf{x} = \mathbf{b}$  has a solution.

And a linear transformation  $\mathbb{R}^n \rightarrow \mathbb{R}^m$  is onto if and only if its range is all of  $\mathbb{R}^m$ . Putting these together:  $\mathbf{x} \mapsto A\mathbf{x}$  is onto if and only if  $A\mathbf{x} = \mathbf{b}$  is always consistent, and this is equivalent to many things:

**Theorem 4: Existence of solutions to linear systems:** For an  $m \times n$  matrix  $A$ , the following statements are logically equivalent (i.e. for any particular matrix  $A$ , they are all true or all false):

- For each  $\mathbf{b}$  in  $\mathbb{R}^m$ , the equation  $A\mathbf{x} = \mathbf{b}$  has a solution.
- Each  $\mathbf{b}$  in  $\mathbb{R}^m$  is a linear combination of the columns of  $A$ .
- The columns of  $A$  span  $\mathbb{R}^m$ .
- $\text{rref}(A)$  has a pivot in every row.
- The linear transformation  $\mathbf{x} \mapsto A\mathbf{x}$  is onto.
- The range of the linear transformation  $\mathbf{x} \mapsto A\mathbf{x}$  is  $\mathbb{R}^m$ .

## Conceptual problems regarding linear independence and linear transformations:

In problems without specific numbers, it's often better **not** to use row-reduction.

The all-important equation:  $T(c_1\mathbf{v}_1 + \cdots + c_p\mathbf{v}_p) = c_1T(\mathbf{v}_1) + \cdots + c_pT(\mathbf{v}_p)$ .

**Example:** Prove that, if  $\{\mathbf{u}, \mathbf{v}, \mathbf{w}\}$  is linearly dependent and  $T$  is a linear transformation, then  $\{T(\mathbf{u}), T(\mathbf{v}), T(\mathbf{w})\}$  is linearly dependent.

**Step 1** Rewrite the mathematical terms in the question as formulas.

What we know: there are scalars  $c_1, c_2, c_3$  not all zero with  $c_1\mathbf{u} + c_2\mathbf{v} + c_3\mathbf{w} = \mathbf{0}$ .

What we want to show: there are scalars  $d_1, d_2, d_3$  not all zero such that

$$d_1T(\mathbf{u}) + d_2T(\mathbf{v}) + d_3T(\mathbf{w}) = \mathbf{0}.$$

**Step 2** Fill in the missing steps by rearranging vector equations.

## Conceptual problems regarding linear independence and linear transformations:

The all-important equation:  $T(c_1\mathbf{v}_1 + \cdots + c_p\mathbf{v}_p) = c_1T(\mathbf{v}_1) + \cdots + c_pT(\mathbf{v}_p)$ .

**Example:** Prove that, if  $\{\mathbf{u}, \mathbf{v}, \mathbf{w}\}$  is linearly dependent and  $T$  is a linear transformation, then  $\{T(\mathbf{u}), T(\mathbf{v}), T(\mathbf{w})\}$  is linearly dependent.

**Step 1** Rewrite the mathematical terms in the question as formulas.

What we know: there are scalars  $c_1, c_2, c_3$  not all zero with  $c_1\mathbf{u} + c_2\mathbf{v} + c_3\mathbf{w} = \mathbf{0}$ .

What we want to show: there are scalars  $d_1, d_2, d_3$  not all zero such that  $d_1T(\mathbf{u}) + d_2T(\mathbf{v}) + d_3T(\mathbf{w}) = \mathbf{0}$ .

**Step 2** Fill in the missing steps by rearranging vector equations.

**Answer:** We know  $c_1\mathbf{u} + c_2\mathbf{v} + c_3\mathbf{w} = \mathbf{0}$  for some scalars  $c_1, c_2, c_3$  not all zero.

Apply  $T$  to both sides:  $T(c_1\mathbf{u} + c_2\mathbf{v} + c_3\mathbf{w}) = T(\mathbf{0})$ .

## Conceptual problems regarding linear independence and linear transformations:

In problems without specific numbers, it's often better **not** to use row-reduction.

The all-important equation:  $T(c_1\mathbf{v}_1 + \cdots + c_p\mathbf{v}_p) = c_1T(\mathbf{v}_1) + \cdots + c_pT(\mathbf{v}_p)$ .

**Example:** Prove that, if  $\{\mathbf{u}, \mathbf{v}, \mathbf{w}\}$  is linearly dependent and  $T$  is a linear transformation, then  $\{T(\mathbf{u}), T(\mathbf{v}), T(\mathbf{w})\}$  is linearly dependent.

**Step 1** Rewrite the mathematical terms in the question as formulas.

What we know: there are scalars  $c_1, c_2, c_3$  not all zero with  $c_1\mathbf{u} + c_2\mathbf{v} + c_3\mathbf{w} = \mathbf{0}$ .

What we want to show: there are scalars  $d_1, d_2, d_3$  not all zero such that  $d_1T(\mathbf{u}) + d_2T(\mathbf{v}) + d_3T(\mathbf{w}) = \mathbf{0}$ .

**Step 2** Fill in the missing steps by rearranging vector equations.

**Answer:** We know  $c_1\mathbf{u} + c_2\mathbf{v} + c_3\mathbf{w} = \mathbf{0}$  for some scalars  $c_1, c_2, c_3$  not all zero.

Apply  $T$  to both sides:  $T(c_1\mathbf{u} + c_2\mathbf{v} + c_3\mathbf{w}) = T(\mathbf{0})$ .

Because  $T$  is a linear transformation:  $c_1T(\mathbf{u}) + c_2T(\mathbf{v}) + c_3T(\mathbf{w}) = \mathbf{0}$ .

Because  $c_1, c_2, c_3$  are not all zero, this is a linear dependence relation among  $T(\mathbf{u}), T(\mathbf{v}), T(\mathbf{w})$ .
