

1. (7 points) Compute the following two improper integrals, or explain why they do not converge. **Simplify your answer as much as possible.**

(a)

$$\begin{aligned}
 & \int_e^{\infty} \frac{1}{x(1+\ln x)^2} dx. \\
 &= \lim_{t \rightarrow \infty} \int_e^t \frac{1}{x(1+\ln x)^2} dx \\
 &= \lim_{t \rightarrow \infty} \left[\frac{1}{1+\ln x} \right]_e^t \\
 &= \lim_{t \rightarrow \infty} \frac{1}{1+\ln t} - \frac{1}{1+1} \\
 &= -\frac{1}{2} \quad \text{because, as } t \rightarrow \infty \\
 & \quad \ln t \rightarrow \infty \\
 & \quad \text{so } \frac{1}{1+\ln t} \rightarrow 0
 \end{aligned}$$

substitution
 $u = 1 + \ln x$
 $du = \frac{1}{x} dx$

(b)

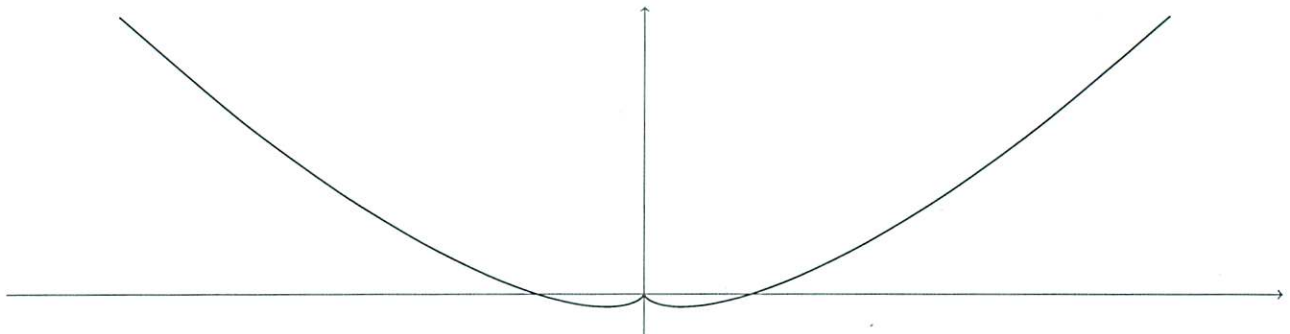

$$\begin{aligned}
 & \int_{\frac{1}{e}}^1 \frac{1}{x(1+\ln x)^2} dx. \\
 &= \lim_{t \rightarrow \frac{1}{e}^+} \int_t^1 \frac{1}{x(1+\ln x)^2} dx \\
 &= \lim_{t \rightarrow \frac{1}{e}^+} \left[\frac{1}{1+\ln x} \right]_t^1 \\
 &= \lim_{t \rightarrow \frac{1}{e}^+} \frac{1}{1} - \frac{1}{1+\ln t}.
 \end{aligned}$$

as $t \rightarrow \frac{1}{e}^+$
 $\ln t \rightarrow -1^+$
 so $\frac{1}{1+\ln t} \rightarrow \infty$ so this integral diverges.

2. (14 points) Let C be the parametrised curve with equation

$$x = \frac{4}{3}t^3, \quad y = t^4 - \frac{t^2}{2},$$

as shown in the diagram below.

- (a) Find the point(s) where C has a horizontal tangent. Simplify your answer as much as possible.

C has a horizontal tangent when $\frac{dy}{dt} = 0$ and $\frac{dx}{dt} \neq 0$

$$\frac{dy}{dt} = 0 \text{ when } 4t^3 - t = 0$$

$$4t(t^2 - \frac{1}{4}) = 0$$

$$t = 0 \text{ or } t = \frac{1}{2} \text{ or } t = -\frac{1}{2}$$

When $t = 0$: $\frac{dx}{dt} = 4t^2 = 0$ — $t = 0$ corresponds to the point $(0, 0)$, and from the diagram we see there is no horizontal tangent there.

When $t = \frac{1}{2}$: $\frac{dx}{dt} = 4(\frac{1}{2})^2 \neq 0$
 When $t = -\frac{1}{2}$: $\frac{dx}{dt} = 4(-\frac{1}{2})^2 \neq 0$ } \therefore these do give horizontal tangents.

Corresponding (x, y) coordinates are:

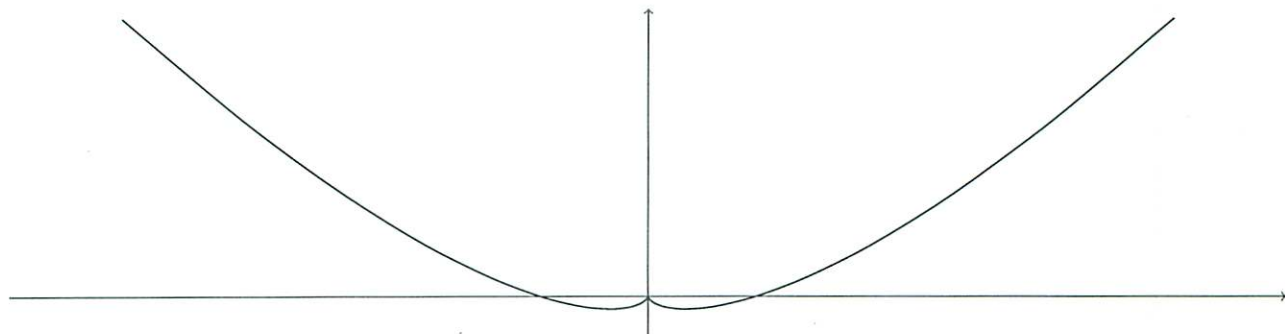

$$t = \frac{1}{2}: \quad x = \frac{4}{3} \cdot \frac{1}{8} = \frac{1}{6} \quad y = \frac{1}{16} - \frac{1}{2} \cdot \frac{1}{4} = -\frac{1}{8}$$

$$t = -\frac{1}{2}: \quad x = \frac{4}{3} \cdot (-\frac{1}{8}) = -\frac{1}{6} \quad y = \frac{1}{16} - \frac{1}{2} \cdot \frac{1}{4} = -\frac{1}{8}$$

$\therefore C$ has horizontal tangents at $(\frac{1}{6}, -\frac{1}{8})$ and $(-\frac{1}{6}, -\frac{1}{8})$.

(b) For your convenience, here again is the information about the parametrised curve C :

$$x = \frac{4}{3}t^3, \quad y = t^4 - \frac{t^2}{2}.$$

Find the length of the part of C with $-3 \leq t \leq -1$. Simplify your answer as much as possible.

$$\text{length} = \int_{-3}^{-1} \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt$$

$$= \int_{-3}^{-1} \sqrt{(4t^2)^2 + (4t^3 - t)^2} dt$$

$$= \int_{-3}^{-1} \sqrt{16t^4 + 16t^6 - 8t^4 + t^2} dt$$

$$= \int_{-3}^{-1} \sqrt{16t^6 + 8t^4 + t^2} dt$$

$$= \int_{-3}^{-1} \sqrt{t^2(4t^2 + 1)^2} dt$$

$$= \int_{-3}^{-1} |t| |4t^2 + 1| dt$$

$4t^2 + 1 > 0$ always,
 $t < 0$ for $-3 \leq t \leq -1$.

$$= \int_{-3}^{-1} -t(4t^2 + 1) dt$$

$$= \left[-4 \frac{t^4}{4} - \frac{t^2}{2} \right]_{-3}^{-1} = \left(-1 - \frac{1}{2} \right) - \left(-81 - \frac{9}{2} \right) = 84$$
