

§1.7: Linear Independence

In this picture, the plane is $\text{Span}\{\mathbf{u}, \mathbf{v}, \mathbf{w}\} = \text{Span}\{\mathbf{u}, \mathbf{v}\}$, so we do not need to include \mathbf{w} to describe this plane.

We can think that \mathbf{w} is “too similar” to \mathbf{u} and \mathbf{v} - and linear dependence is the way to make this idea precise.

Definition: A set of vectors $\{\mathbf{v}_1, \dots, \mathbf{v}_p\}$ is *linearly independent* if the **only solution** to the vector equation

$$x_1 \mathbf{v}_1 + \dots + x_p \mathbf{v}_p = \mathbf{0}$$

is the **trivial solution** ($x_1 = \dots = x_p = 0$).

Definition: A set of vectors $\{\mathbf{v}_1, \dots, \mathbf{v}_p\}$ is *linearly independent* if the **only solution** to the vector equation

$$x_1\mathbf{v}_1 + \dots + x_p\mathbf{v}_p = \mathbf{0}$$

is the **trivial solution** ($x_1 = \dots = x_p = 0$).

The opposite of linearly independent is linearly dependent:

Definition: A set of vectors $\{\mathbf{v}_1, \dots, \mathbf{v}_p\}$ is *linearly dependent* if there are weights c_1, \dots, c_p , **not all zero**, such that

$$c_1\mathbf{v}_1 + \dots + c_p\mathbf{v}_p = \mathbf{0}.$$

The equation $c_1\mathbf{v}_1 + \dots + c_p\mathbf{v}_p = \mathbf{0}$ is a **linear dependence relation**.

Definition: A set of vectors $\{\mathbf{v}_1, \dots, \mathbf{v}_p\}$ is *linearly dependent* if there are weights c_1, \dots, c_p , **not all zero**, such that

$$c_1 \mathbf{v}_1 + \dots + c_p \mathbf{v}_p = \mathbf{0}.$$

The equation $c_1 \mathbf{v}_1 + \dots + c_p \mathbf{v}_p = \mathbf{0}$ is a *linear dependence relation*.

A picture of a linear dependence relation: “you can use the given directions to move in a circle”.

$$\mathbf{u} + 2\mathbf{v} - \mathbf{w} = \mathbf{0}$$

$$x_1 \mathbf{v}_1 + \cdots + x_p \mathbf{v}_p = \mathbf{0}$$

The only solution is $x_1 = \cdots = x_p = 0$
→ linearly independent

There is a solution with some $x_i \neq 0$
→ linearly dependent

$$x_1 \mathbf{v}_1 + \cdots + x_p \mathbf{v}_p = \mathbf{0}$$

The only solution is $x_1 = \cdots = x_p = 0$
 \rightarrow linearly independent

There is a solution with some $x_i \neq 0$
 \rightarrow linearly dependent

Example: $\left\{ \begin{bmatrix} 2 \\ 1 \end{bmatrix}, \begin{bmatrix} 4 \\ 2 \end{bmatrix} \right\}$ is linearly dependent because

$$2 \begin{bmatrix} 2 \\ 1 \end{bmatrix} + (-1) \begin{bmatrix} 4 \\ 2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}.$$

$$x_1 \mathbf{v}_1 + \cdots + x_p \mathbf{v}_p = \mathbf{0}$$

The only solution is $x_1 = \cdots = x_p = 0$
 \rightarrow linearly independent

Example: $\left\{ \begin{bmatrix} 2 \\ 1 \end{bmatrix}, \begin{bmatrix} 3 \\ 0 \end{bmatrix} \right\}$ is linearly independent because

$$x_1 \begin{bmatrix} 2 \\ 1 \end{bmatrix} + x_2 \begin{bmatrix} 3 \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \Rightarrow \begin{aligned} 2x_1 + 3x_2 &= 0 \\ x_1 &= 0 \end{aligned} \Rightarrow x_1 = 0, x_2 = 0.$$

There is a solution with some $x_i \neq 0$
 \rightarrow linearly dependent

Example: $\left\{ \begin{bmatrix} 2 \\ 1 \end{bmatrix}, \begin{bmatrix} 4 \\ 2 \end{bmatrix} \right\}$ is linearly dependent because

$$2 \begin{bmatrix} 2 \\ 1 \end{bmatrix} + (-1) \begin{bmatrix} 4 \\ 2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}.$$

$$x_1 \mathbf{v}_1 + \cdots + x_p \mathbf{v}_p = \mathbf{0}$$

The only solution is $x_1 = \cdots = x_p = 0$
 (i.e. unique solution)
 → linearly independent

Informally: $\mathbf{v}_1, \dots, \mathbf{v}_p$ are in “totally different directions”; there is “no relationship” between $\mathbf{v}_1, \dots, \mathbf{v}_p$.

There is a solution with some $x_i \neq 0$
 (i.e. infinitely many solutions)
 → linearly dependent

Informally: $\mathbf{v}_1, \dots, \mathbf{v}_p$ are in “similar directions”

Some easy cases:

- Sets containing the zero vector $\{\mathbf{0}, \mathbf{v}_2, \dots, \mathbf{v}_p\}$: then the linear dependence equation is

$$x_1 \mathbf{0} + x_2 \mathbf{v}_2 + \cdots + x_p \mathbf{v}_p = \mathbf{0}.$$

Does this equation have a non-trivial solution?

Some easy cases:

- Sets containing the zero vector $\{\mathbf{0}, \mathbf{v}_2, \dots, \mathbf{v}_p\}$: then the linear dependence equation is

$$x_1 \mathbf{0} + x_2 \mathbf{v}_2 + \dots + x_p \mathbf{v}_p = \mathbf{0}.$$

A non-trivial solution is

$$(1)\mathbf{0} + (0)\mathbf{v}_2 + \dots + (0)\mathbf{v}_p = \mathbf{0},$$

so such a set is **linearly dependent** (it doesn't matter what $\mathbf{v}_2, \dots, \mathbf{v}_p$ are).

Some easy cases:

- Sets containing the zero vector $\{\mathbf{0}, \mathbf{v}_2, \dots, \mathbf{v}_p\}$: then the linear dependence equation is

$$x_1 \mathbf{0} + x_2 \mathbf{v}_2 + \dots + x_p \mathbf{v}_p = \mathbf{0}.$$

A non-trivial solution is

$$(1)\mathbf{0} + (0)\mathbf{v}_2 + \dots + (0)\mathbf{v}_p = \mathbf{0},$$

so such a set is **linearly dependent** (it doesn't matter what $\mathbf{v}_2, \dots, \mathbf{v}_p$ are).

- Sets containing one vector $\{\mathbf{v}\}$: then the linear dependence equation is

$$x\mathbf{v} = \mathbf{0} \quad \text{i.e.} \quad \begin{bmatrix} xv_1 \\ \vdots \\ xv_n \end{bmatrix} = \begin{bmatrix} 0 \\ \vdots \\ 0 \end{bmatrix}.$$

If some $v_i \neq 0$, then $x = 0$ is the only solution. So $\{\mathbf{v}\}$ is **linearly independent** if $\mathbf{v} \neq \mathbf{0}$.

Some easy cases:

- Sets containing two vectors $\{\mathbf{u}, \mathbf{v}\}$: then the linear dependence equation is

$$x_1 \mathbf{u} + x_2 \mathbf{v} = \mathbf{0}.$$

Using the same argument as in the example on p4, we can show that, if $\mathbf{v} = c\mathbf{u}$ for any c , then \mathbf{u} and \mathbf{v} are linearly dependent:

$$\mathbf{v} = c\mathbf{u} \quad \text{means} \quad c\mathbf{u} + (-1)\mathbf{v} = \mathbf{0}.$$

The same argument applies if $\mathbf{u} = d\mathbf{v}$ for any d .

Is this the only way in which two vectors can be linearly dependent?

Some easy cases:

- Sets containing two vectors $\{\mathbf{u}, \mathbf{v}\}$: then the linear dependence equation is

$$x_1 \mathbf{u} + x_2 \mathbf{v} = \mathbf{0}.$$

Using the same argument as in the example on p4, we can show that, if $\mathbf{v} = c\mathbf{u}$ for any c , then \mathbf{u} and \mathbf{v} are linearly dependent:

$$\mathbf{v} = c\mathbf{u} \quad \text{means} \quad c\mathbf{u} + (-1)\mathbf{v} = \mathbf{0}.$$

The same argument applies if $\mathbf{u} = d\mathbf{v}$ for any d .

Is this the only way in which two vectors can be linearly dependent?

Suppose we have $x_1 \mathbf{u} + x_2 \mathbf{v} = \mathbf{0}$ and x_1, x_2 are not both zero.

If $x_1 \neq 0$, then we can divide by it: $\mathbf{u} = \frac{-x_2}{x_1} \mathbf{v}$.

Similarly, if $x_2 \neq 0$, then $\mathbf{v} = \frac{-x_1}{x_2} \mathbf{u}$.

So $\{\mathbf{u}, \mathbf{v}\}$ is linearly dependent if and only if one of the vectors is a multiple of the other, i.e. \mathbf{u}, \mathbf{v} are in the same or opposite direction.

When there are more vectors, it is hard to tell quickly if a set is linearly independent or dependent.

As shown in this example from p3, three vectors can be linearly dependent without any of them being a multiple of any other vector.

When there are more vectors, it is hard to tell quickly if a set is linearly independent or dependent.

As shown in this example from p3, three vectors can be linearly dependent without any of them being a multiple of any other vector.

The correct generalisation of the two-vector case is the following: a set of vectors is **linearly dependent** if and only if **one of the vectors is a linear combination of the others**. (More specifically: if the weight x_i in the linear dependency relation $x_1\mathbf{v}_1 + \cdots + x_p\mathbf{v}_p = \mathbf{0}$ is non-zero, then \mathbf{v}_i is a linear combination of the other \mathbf{v} s, by the same argument as in the case of two vectors.)

A non-trivial solution to $A\mathbf{x} = \mathbf{0}$ is a linear dependence relation between the columns of A : $A\mathbf{x} = \mathbf{0}$ means $x_1\mathbf{a}_1 + \cdots + x_n\mathbf{a}_n = \mathbf{0}$.

Theorem: Uniqueness of solutions for linear systems: For a matrix A , the following are equivalent:

- a. $A\mathbf{x} = \mathbf{0}$ has no non-trivial solution.
- b. If $A\mathbf{x} = \mathbf{b}$ is consistent, then it has a unique solution.
- c. The columns of A are linearly independent.
- d. $\text{rref}(A)$ has a pivot in every column (i.e. all variables are basic).

A non-trivial solution to $A\mathbf{x} = \mathbf{0}$ is a linear dependence relation between the columns of A : $A\mathbf{x} = \mathbf{0}$ means $x_1\mathbf{a}_1 + \cdots + x_n\mathbf{a}_n = \mathbf{0}$.

Theorem: Uniqueness of solutions for linear systems: For a matrix A , the following are equivalent:

- a. $A\mathbf{x} = \mathbf{0}$ has no non-trivial solution.
- b. If $A\mathbf{x} = \mathbf{b}$ is consistent, then it has a unique solution.
- c. The columns of A are linearly independent.
- d. $\text{rref}(A)$ has a pivot in every column (i.e. all variables are basic).

In particular: the row reduction algorithm produces at most one pivot in each row of $\text{rref}(A)$. So, if A has more columns than rows (a “fat” matrix), then $\text{rref}(A)$ cannot have a pivot in every column.

So a set of **more than n vectors in \mathbb{R}^n** is always **linearly dependent**.

Exercise: Combine this with the Theorem of Existence of Solutions (Week 2 p23) to show that a set of n linearly independent vectors span \mathbb{R}^n .

Theorem: Uniqueness of solutions for linear systems: For a matrix A , the following are equivalent:

- a. $A\mathbf{x} = \mathbf{0}$ has no non-trivial solution.
- b. If $A\mathbf{x} = \mathbf{b}$ is consistent, then it has a unique solution.
- c. The columns of A are linearly independent.
- d. $\text{rref}(A)$ has a pivot in every column (i.e. all variables are basic).

Study tip: now that we're working with different types of mathematical objects (matrices, vectors, equations, numbers), you should be careful which properties apply to which objects: e.g. linear independence applies to a set of vectors, not to a matrix

(at least not until Chapter 4). Do **not** say “ $\begin{bmatrix} 1 & 2 & -3 \\ 3 & 5 & 9 \\ 5 & 9 & 3 \end{bmatrix}$ is linearly dependent” when

you mean “ $\left\{ \begin{bmatrix} 1 \\ 3 \\ 5 \end{bmatrix}, \begin{bmatrix} 2 \\ 5 \\ 9 \end{bmatrix}, \begin{bmatrix} -3 \\ 9 \\ 3 \end{bmatrix} \right\}$ are linearly dependent”.

Partial summary of linear dependence:

The definition: $x_1 \mathbf{v}_1 + \cdots + x_p \mathbf{v}_p = \mathbf{0}$ has a non-trivial solution (not all x_i are zero); equivalently, it has infinitely many solutions.

Equivalently: **one** of the vectors is a linear combination of the others (see p8, also Theorem 7 in textbook). But it might not be the case that every vector in the set is a linear combination of the others (see ex. sheet #5 q2c).

Computation: $\text{rref} \left(\begin{bmatrix} | & & | \\ \mathbf{v}_1 & \cdots & \mathbf{v}_p \\ | & & | \end{bmatrix} \right)$ has at least one free variable.

Informal idea: the vectors are in “similar directions”

Partial summary of linear dependence (continued):

Easy examples:

- Sets containing the zero vector;
- Sets containing “too many” vectors (more than n vectors in \mathbb{R}^n);
- Multiples of vectors: e.g. $\left\{ \begin{bmatrix} 2 \\ 1 \end{bmatrix}, \begin{bmatrix} 4 \\ 2 \end{bmatrix} \right\}$ (this is the only possibility if the set has two vectors);
- Other examples: e.g. $\left\{ \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} \right\}$. Make your own examples!

Adding vectors to a linearly dependent set still makes a linearly dependent set (see ex. sheet #5 Q2d).

Equivalent: removing vectors from a linearly independent set still makes a linearly independent set (because P implies Q is equivalent to $(\text{not } Q) \text{ implies } (\text{not } P)$ - this is the **contrapositive**).

Study tips:

- Linear independence will appear again in many topics throughout the class, so I suggest you add to this summary throughout the semester, so you can see the connections between linear independence and the other topics.

Study tips:

- Linear independence will appear again in many topics throughout the class, so I suggest you add to this summary throughout the semester, so you can see the connections between linear independence and the other topics.
- Topic summaries like this one is useful for exam revision, but even more useful is [making these summaries yourself](#). I encourage you to use my summary as a template for your own summaries of the other topics.
