Remember the addition and scalar multiplication of matrices:

e.g 
$$\begin{bmatrix} 4 & 0 & 5 \\ -1 & 3 & 2 \end{bmatrix} + \begin{bmatrix} 1 & 1 & 1 \\ 3 & 5 & 7 \end{bmatrix} = \begin{bmatrix} 5 & 1 & 6 \\ 2 & 8 & 9 \end{bmatrix}$$
.

$$(cA)_{ij} = ca_{ij},$$

e.g. 
$$(-3)\begin{bmatrix} 4 & 0 & 5 \\ -1 & 3 & 2 \end{bmatrix} = \begin{bmatrix} -12 & 0 & -15 \\ 3 & -9 & -6 \end{bmatrix}$$

Is this really different from  $\mathbb{R}^6$ ?

$$(-3)\begin{bmatrix} 4\\0\\0\\-1\\-1 \end{bmatrix} = \begin{bmatrix} -12\\0\\-15\\3\\-9\\-6 \end{bmatrix}.$$

:U Math 2207 Linear Algebra

Semester 2 2017, Week 6, Page 1 of 43

Remember from calculus the addition and scalar multiplication of polynomials:

e.g 
$$(2t^2 + 1) + (-t^2 + 3t + 2) = t^2 + 3t + 3$$
.

e.g 
$$(-3)(-t^2 + 3t + 2) = 3t^2 - 9t - 6$$
.

Is this really different from  $\mathbb{R}^3$ ?

$$\begin{bmatrix} 1 \\ 0 \\ 2 \end{bmatrix} + \begin{bmatrix} 2 \\ 3 \\ -1 \end{bmatrix} = \begin{bmatrix} 3 \\ 3 \end{bmatrix}.$$

$$(-3)\begin{bmatrix} 2\\3\\-1\end{bmatrix} = \begin{bmatrix} -6\\-9\\3\end{bmatrix}. \leftarrow \text{coefficient of } t$$

$$\leftarrow \text{coefficient of } t$$

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 6, Page 2 of 43

A **vector space** is a nonempty set V of objects, called *vectors*, on which are defined two operations, called *addition* and *multiplication by scalars* (real numbers), subject to the ten axioms below. The axioms must hold for all  $\mathbf{u}$ ,  $\mathbf{v}$  and  $\mathbf{w}$  in V and for all scalars c and d.

- 1.  $\mathbf{u} + \mathbf{v}$  is in V.
- $2. \ u+v=v+u.$
- 3. (u + v) + w = u + (v + w)

The real power of linear algebra is that everything we learned in Chapters 1-3

can be applied to all these abstract vectors, not just to column vectors.

As the examples above showed, there are many objects in mathematics that

"looks" and "feels" like  $\mathbb{R}^n$ . We will also call these vectors.

§4.1, pp217-218: Abstract Vector Spaces

- 4. There is a vector (called the zero vector)  $\mathbf{0}$  in V such that  $\mathbf{u} + \mathbf{0} = \mathbf{u}$ .
- 5. For each **u** in V, there is vector  $-\mathbf{u}$  in V satisfying  $\mathbf{u} + (-\mathbf{u}) = \mathbf{0}$ .
- 6. cu is in V.
- 7.  $c(\mathbf{u} + \mathbf{v}) = c\mathbf{u} + c\mathbf{v}$ .
- 8.  $(c+d)\mathbf{u} = c\mathbf{u} + d\mathbf{u}$ .

The axioms guarantee that the proof of every result and theorem from Chapters

1-3 will work for our new definition of vectors.

sense. This addition and scalar multiplication must obey some "sensible rules"

called axioms (see next page).

multiplied by scalars - i.e. where the concept of "linear combination" makes

You should think of abstract vectors as objects which can be added and

- 9. (cd)**u** = c(d**u**).
- 10. Iu = u.

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 6, Page 4 of 43

Examples of vector spaces:

 $M_{2\times3}$ , the set of  $2\times3$  matrices.

Let's check axiom 4. There is a vector (called the zero vector)  $\mathbf{0}$  in V such that  $\mathbf{u} + \mathbf{0} = \mathbf{u}$ .

The zero vector for  $M_{2 imes3}$  is  $egin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$ 

You can check the other 9 axioms by using the properties of matrix addition and scalar multiplication (page 5 of week 4 slides, theorem 2.1 in textbook).

Similarly,  $M_{m \times n}$ , the set of all  $m \times n$  matrices, is a vector space.

Is the set of all matrices (of all sizes) a vector space?

No, because we cannot add two matrices of different sizes, so axiom 1 does not hold.

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 6, Page 5 of 43

Examples of vector spaces:

 $\mathbb{P}_n$  , the set of polynomials of degree at most n.

Each of these polynomials has the form

$$a_0 + a_1 t + a_2 t^2 + \dots + a_n t^n,$$

for some numbers  $a_0, a_1, \ldots, a_n$ .

Let's check axiom 4. There is a vector (called the zero vector)  $\mathbf{0}$  in V such that  $\mathbf{u} + \mathbf{0} = \mathbf{u}$ . The zero vector for  $\mathbb{P}_n$  is  $0 + 0t + 0t^2 + \cdots + 0t^n$ .

Let's check axiom 1.  $\mathbf{u} + \mathbf{v}$  is in V.

$$(a_0+a_1t+a_2t^2+\cdots+a_nt^n)+(b_0+b_1t+b_2t^2+\cdots+b_nt^n)\\ =(a_0+b_0)+(a_1+b_1)t+(a_2+b_2)t^2+\cdots+(a_n+b_n)t^n, \text{ which also has degree}$$

Exercise: convince yourself that the other axioms are true.

HKBU Math 2207 Linear Algebra

at most n.

Semester 2 2017, Week 6, Page 6 of 43

Examples of vector spaces:

Warning: the set of polynomials of degree exactly  $\boldsymbol{n}$  is not a vector space, because axiom 1 does not hold:

$$\underbrace{(t^3 + t^2)}_{\text{degree 3}} + \underbrace{(-t^3 + t^2)}_{\text{degree 3}} = \underbrace{2t^2}_{\text{degree 2}}$$

 $\mathbb P$  , the set of all polynomials (no restriction on the degree) is a vector space.

 $C(\mathbb{R})$ , the set of all continuous functions is a vector space (because the sum of two continuous functions is continuous, the zero function is continuous, etc.)

These last two examples are a bit different from  $M_{m \times n}$  and  $\mathbb{P}_n$  because they are infinite-dimensional (more later, see week 8 §4.5).

(You do not have to remember the notation  $M_{m \times n}, \mathbb{P}_n$ , etc. for the vector spaces.)

Let W be the set of symmetric  $2\times 2$  matrices. Is W a vector space?

1. 
$$\mathbf{u} + \mathbf{v} \sin V$$
.  
2.  $\mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u}$ .  
3.  $\mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u}$ .

3. 
$$(u + v) + w = u + (v + w)$$

4. There is a vector (called the zero vector)  $\mathbf{0}$  in V such that  $\mathbf{u} + \mathbf{0} = \mathbf{u}$ .

5. For each **u** in V, there is vector  $-\mathbf{u}$  in V satisfying  $\mathbf{u} + (-\mathbf{u}) = \mathbf{0}$ .

cu is in V.

7.  $c(\mathbf{u} + \mathbf{v}) = c\mathbf{u} + c\mathbf{v}$ .

8. 
$$(c+d)\mathbf{u} = c\mathbf{u} + d\mathbf{u}$$
.

9. 
$$(cd)\mathbf{u} = c(d\mathbf{u})$$
.

10. 
$$1u = u$$
.

HKBU Math 2207 Linear Algebra

W is a subset of  $M_{2\times 2}$ . Axioms 2, 3, 5, 7, 8, 9, 10 hold for W because they hold for  $M_{2\times 2}$ .

So we only need to check axioms 1, 4, 6.

**Definition**: A subset W of a vector space V is a subspace of V if the closure axioms 1,4,6 hold:

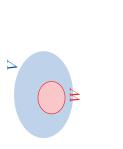

- 4. The zero vector is in  $W_{\cdot}$
- 1. If  $\mathbf{u}, \mathbf{v}$  are in W, then their sum  $\mathbf{u} + \mathbf{v}$  is in W. (closed under addition)
- 6. If  ${f u}$  is in W and c is any scalar, the scalar multiple  $c{f u}$  is in W . (closed under scalar multiplication)

Fact: W is itself a vector space (with the same addition and scalar multiplication as V) if and only if W is a subspace of V

all three axioms directly, for all  $\mathbf{u}, \mathbf{v}, c$ To show that  ${\cal W}$  is a subspace, check (i.e. use variables).

show that one of the axioms is false, To show that  ${\cal W}$  is not a subspace, for a particular value of  $\mathbf{u}, \mathbf{v}, c$ .

HKBU Math 2207 Linear Algebra

HKBU Math 2207 Linear Algebra Semester 2 2017, Week 6, Page 9 of 43

**Definition**: A subset W of a vector space V is a subspace of V if the closure axioms 1,4,6 hold:

- 4. The zero vector is in  $W_{\cdot}$
- 1. If  ${\bf u},{\bf v}$  are in W, then their sum  ${\bf u}+{\bf v}$  is in W. (closed under addition)
- 6. If  ${f u}$  is in W and c is any scalar, the scalar multiple  $c{f u}$  is in W . (closed under scalar multiplication)

**Example**: Let W be the set of vectors of the form  $\begin{vmatrix} a \\ b \end{vmatrix}$ , where a,b can take any value.

 $(W ext{ is the } x_1x_3 ext{-plane.})$  We show that  $W ext{ is a subspace of } \mathbb{R}^3$ :

4. The zero vector is in W because it is the vector with  $a=0,\,b=0.$ 

1. 
$$\begin{bmatrix} a \\ b \\ b \end{bmatrix} + \begin{bmatrix} x \\ 0 \\ y \end{bmatrix} = \begin{bmatrix} a+x \\ 0 \\ b+y \end{bmatrix} \text{ is in } W.$$

$$\begin{bmatrix} 0 \\ b \end{bmatrix} + \begin{bmatrix} 0 \\ y \end{bmatrix} = \begin{bmatrix} 0 \\ b+y \end{bmatrix} \text{ i}$$

$$\begin{bmatrix} a \\ 0 \end{bmatrix} = \begin{bmatrix} ca \\ 0 \end{bmatrix} \text{ is in } W.$$

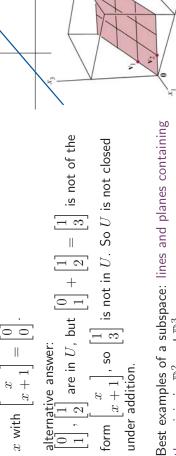

Although W "feels like"  $\mathbb{R}^2$ , note that  $\mathbb{R}^2$ is not a subspace of  $\mathbb{R}^3$  - vectors in  $\mathbb{R}^2$ 

have two entries, so they are not in  $\mathbb{R}^3$ .

Semester 2 2017, Week 6, Page 10 of 43

**Example**: Let U be the set of vectors of the form  $\begin{bmatrix} x \\ x+1 \end{bmatrix}$ , where x can take any value. To show that U is not a subspace of  $\mathbb{R}^2$ , we need to find one counterexample to one of

4. The zero vector is not in U , because there is no value of x with  $\begin{bmatrix} x\\x+1 \end{bmatrix} = \begin{bmatrix} 0\\0 \end{bmatrix}.$ 

An alternative answer:  $1. \begin{bmatrix} 0 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 2 \end{bmatrix} \text{ are in } U, \text{ but } \begin{bmatrix} 0 \\ 1 \end{bmatrix} + \begin{bmatrix} 1 \\ 2 \end{bmatrix} = \begin{bmatrix} 1 \\ 3 \end{bmatrix} \text{ is not of the }$ form  $\begin{bmatrix} x \\ x+1 \end{bmatrix}$ , so  $\begin{bmatrix} 1 \\ 3 \end{bmatrix}$  is not in U. So U is not closed Semester 2 2017, Week 6, Page 11 of 43

**Example**: Let Q be the set of polynomials  $\mathbf{p}(t)$  of degree at most 3 with  $\mathbf{p}(2) = 0$ . We show that Q is a subspace of  $\mathbb{P}_3$ :

- 4. The zero polynomial is in Q because  $\mathbf{0}(2)=0+0\cdot 2+0\cdot 2^2+0\cdot 2^3=0$ .
- 1. For  $\mathbf{p}, \mathbf{q}$  in Q, we have  $(\mathbf{p} + \mathbf{q})(2) = \mathbf{p}(2) + \mathbf{q}(2) = 0 + 0 = 0$ , so  $\mathbf{p} + \mathbf{q}$  is in Q.
- 6. For  $\mathbf{p}$  in Q and any scalar c, we have  $(c\mathbf{p})(2)=c(\mathbf{p}(2))=c0=0$ , so  $c\mathbf{p}$  is in Q.

**Example**: In every vector space V, the set  $\{0\}$  containing only the zero vector is a

- 4. 0 is clearly in the subspace.
- 1. 0+0=0 (use axiom 4:  $0+\mathbf{u}=\mathbf{u}$  for all  $\mathbf{u}$  in V)
- 6. c0 = 0 (use axiom 7: c(0+0) = c0 + c0; and left hand side is c0.)
- $\{0\}$  called the zero subspace.

**Example**: For every vector space V, the whole space V is a subspace.

HKBU Math 2207 Linear Algebra

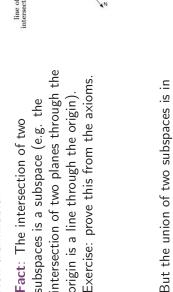

Semester 2 2017, Week 6, Page 12 of 43

HKBU Math 2207 Linear Algebra

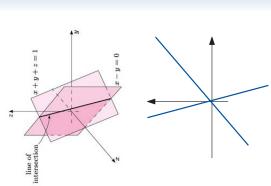

the origin in  $\mathbb{R}^2$  and  $\mathbb{R}^3$ 

under addition.

intersection of two planes through the origin is a line through the origin). subspaces is a subspace (e.g. the

of two lines through the origin is not a line nor a plane through the origin, see general not a subspace (e.g. the union But the union of two subspaces is in also ex sheet Q1b).

Semester 2 2017, Week 6, Page 13 of 43

HKBU Math 2207 Linear Algebra

The first of two shortcuts to show that a set is a subspace:

Theorem 1: Spans are subspaces: If  $\mathbf{v}_1, \dots, \mathbf{v}_p$  are vectors in a vector space V, then Span  $\{\mathbf{v}_1, \dots, \mathbf{v}_p\}$  is a subspace of V.

Redo Example: (p10) Let 
$$W$$
 be the set of vectors of the form  $\begin{vmatrix} a \\ b \end{vmatrix}$  , where

$$a,b$$
 can take any value. We can rewrite such a vector as  $\begin{bmatrix} a \\ b \end{bmatrix} = a \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} + b \begin{bmatrix} 0 \\ 1 \end{bmatrix}$ . Because  $a$  and  $b$  can take any value, this shows that

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 6, Page 14 of 43

The first of two shortcuts to show that a set is a subspace:

**Theorem 1: Spans are subspaces**: If  $\mathbf{v}_1, \dots, \mathbf{v}_p$  are vectors in a vector space V, then Span  $\{\mathbf{v}_1, \dots, \mathbf{v}_p\}$  is a subspace of V.

Redo Example: (p8) Let  $Sym_{2\times 2}$  be the set of symmetric  $2\times 2$  matrices, i.e. the set of matrices of the form  $\begin{bmatrix} a & b \\ b & d \end{bmatrix}$  where a,b,d can take any value. We can rewrite such a matrix as  $\begin{bmatrix} a & b \\ b & d \end{bmatrix} = a \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix} + b \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} + d \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix}$ . So  $Sym_{2\times 2} = \mathrm{Span}\left\{ \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix} \right\}$  and is therefore a subspace of  $M_{2\times 2}$ .

rite such a matrix as 
$$\begin{bmatrix} a & b \\ b & d \end{bmatrix} = a \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix} + b \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} + d \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix}$$
. So

$$Sym_{2 imes 2} = \mathsf{Span}\left\{ egin{bmatrix} 1 & 0 & 1 \ 0 & 0 \end{bmatrix}, egin{bmatrix} 0 & 1 \ 0 & 1 \end{bmatrix} 
ight\}$$
 and is therefore a subspace of  $M_{2 imes 2}$ .

Warning: Theorem 1 does not help us show that a set is not a subspace.

## **THEOREM 1: Spans are subspaces**

If  $\mathbf{v}_1,...,\mathbf{v}_p$  are vectors in a vector space V, then Span $\{\mathbf{v}_1,...,\mathbf{v}_p\}$  is a subspace of V.

Proof: We check axioms 4, 1 and 6 in the definition of a subspace.

4. **0** is in Span $\{\mathbf{v}_1, ..., \mathbf{v}_p\}$  since

$$\mathbf{0} = \mathbf{v}_1 + \mathbf{v}_2 + \cdots + \mathbf{v}_p$$

1. To show that Span $\{v_1,\dots,v_p\}$  is closed under addition, we choose two arbitrary vectors in Span $\{v_1,\dots,v_p\}$  :

$$\mathbf{u} = a_1 \mathbf{v}_1 + a_2 \mathbf{v}_2 + \dots + a_p \mathbf{v}_p$$
and
$$\mathbf{v} = b_1 \mathbf{v}_1 + b_2 \mathbf{v}_2 + \dots + b_p \mathbf{v}_p.$$

Then

$$\mathbf{u} + \mathbf{v} = (a_1\mathbf{v}_1 + a_2\mathbf{v}_2 + \dots + a_p\mathbf{v}_p) + (b_1\mathbf{v}_1 + b_2\mathbf{v}_2 + \dots + b_p\mathbf{v}_p)$$

So  $\mathbf{u} + \mathbf{v}$  is in Span $\{\mathbf{v}_1, \dots, \mathbf{v}_p\}$ .

6. To show that Span $\{v_1,\ldots,v_p\}$  is closed under scalar multiplication, choose an arbitrary number c and an arbitrary vector in Span $\{v_1,\ldots,v_p\}$ :

$$\mathbf{v} = b_1 \mathbf{v}_1 + b_2 \mathbf{v}_2 + \dots + b_p \mathbf{v}_p.$$

Then

$$c\mathbf{V} = c(b_1\mathbf{V}_1 + b_2\mathbf{V}_2 + \dots + b_p\mathbf{V}_p)$$

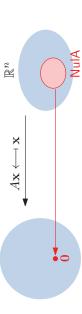

$$= \underline{\qquad \qquad } \mathbf{V}_1 + \underline{\qquad \qquad } \mathbf{V}_2 + \cdots + \underline{\qquad \qquad } \mathbf{V}_p$$

So  $c\mathbf{v}$  is in Span $\{\mathbf{v}_1, \dots, \mathbf{v}_p\}$ .

Since 4,1,6 hold, Span $\{\mathbf{v_1},...,\mathbf{v}_p\}$  is a subspace of V.

The second of two shortcuts to show that a set is a subspace:

**Definition**: The null space of a  $m \times n$  matrix A, written  $\mathrm{Nul}A$ , is the solution set to the homogeneous equation  $A\mathbf{x} = \mathbf{0}$ .

Theorem 2: Null Spaces are Subspaces: The null space of an m imes n matrix Ais a subspace of  $\mathbb{R}^n$ .

This theorem is useful for showing that a set defined by conditions is a subspace. Example: Show that the line y=2x is a subspace of  $\mathbb{R}^2$ .

Answer: y=2x is the solution set to 2x-y=0, which in matrix form is  $\begin{bmatrix} 2 & -1 \end{bmatrix} \mathbf{x} = \mathbf{0}$ . So this solution set is the null space of  $\begin{bmatrix} 2 & -1 \end{bmatrix}$ .

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 6, Page 17 of 43

The **null space** of an  $m \times n$  matrix A, written as Nul A, is the set of all solutions to the homogeneous equation  $A\mathbf{x} = \mathbf{0}$ .

## THEOREM 2: Null spaces are subspaces

The null space of an  $m \times n$  matrix A is a subspace of  $\mathbf{R}^n$ .

**Proof:** Nul A is a subset of  $\mathbb{R}^n$  since A has n columns. We check axioms 4,1,6 in the

definition of a subspace.

- 4. 0 is in Nul A because
- 1. If  $\mathbf{u}$  and  $\mathbf{v}$  are in Nul A, we show that  $\mathbf{u} + \mathbf{v}$  is in Nul A. Because  $\mathbf{u}$  and  $\mathbf{v}$  are in Nul A

#### Therefore

$$A(\mathbf{u} + \mathbf{v}) =$$

6. If **u** is in Nul A and c is a scalar, we show that c**u** iis in Nul A:

$$A(c\mathbf{u}) =$$

Since axioms 4,1,6 hold, Nul A is a subspace of **R**".

Summary:

Axioms for a subspace:

- 4. The zero vector is in W.
- 1. If  $\mathbf{u}, \mathbf{v}$  are in W, then  $\mathbf{u} + \mathbf{v}$  is in W. (closed under addition)
- 6. If  ${f u}$  is in W and c is a scalar, then  $c{f u}$  is in W. (closed under scalar multiplication)

Ways to show that a set  ${\cal W}$  is a subspace:

- Show that  $W = \text{Span}\{\mathbf{v}_1, \dots, \mathbf{v}_p\}$  for some  $\mathbf{v}_1, \dots, \mathbf{v}_p$  (if W is explicitly defined i.e. its description has variables that can take any value).
- Show that W is NulA for some matrix A (if W is implicitly defined i.e. by conditions that vectors must satisfy).
- Show that W is the kernel or range of a linear transformation (later, p42-43).
  - Check all three axioms directly, for all u, v, c.

To show that a set is not a subspace:

Show that one of the axioms is false, for a particular value of u, v, c.

Best examples of a subspace: lines and planes containing the origin in  $\mathbb{R}^2$  and  $\mathbb{R}^3$ .

HKBU Math 2207 Linear Algebra

One example of the power of abstract vector spaces - solving differential equations:

**Question**: What are all the polynomials  ${f p}$  of degree at most  ${f 5}$  that satisfy

$$\frac{d^2}{dt^2}\mathbf{p}(t) - 4\frac{d}{dt}\mathbf{p}(t) + 3\mathbf{p}(t) = 3t - 1?$$

Answer: The differentiation function  $D: \mathbb{P}_5 \to \mathbb{P}_5$  given by  $D(\mathbf{p}) = \frac{d}{dt}\mathbf{p}$  is a linear transformation (later, p39).

The function  $T:\mathbb{P}_5\to\mathbb{P}_5$  given by  $T(\mathbf{p})=\frac{d^2}{dt^2}\mathbf{p}(t)-4\frac{d}{dt}\mathbf{p}(t)+3\mathbf{p}(t)$  is a sum of compositions of linear transformations, so T is also linear.

We can check that the polynomial t+1 is a solution.

So, by the Solutions and Homogeneous Equations Theorem, the solution set to the above differential equation is all polynomials of the form  $t+1+\mathbf{q}(t)$  where  $T(\mathbf{q})=\mathbf{0}$ .

Extra:  $\mathbb{P}_5$  is both the domain and codomain of T, so the Invertible Matrix Theorem applies. So, if the above equation has more than one solution, then there is a polynomial  $\mathbf{g}$  such that  $\frac{d^2}{dx^2}\mathbf{p}(t)-4\frac{d}{dt}\mathbf{p}(t)+3\mathbf{p}(t)=\mathbf{g}(t)$  has no solutions.

Each linear transformation has two vector subspaces associated to it.

For each of these two subspaces, we are interested in two problems:

- a. given a vector v, is it in the subspace?
- b. can we write this subspace as Span  $\{{f v}_1,\dots,{f v}_p\}$  for some vectors  ${f v}_1,\dots,{f v}_p$ ? The set  $\{{f v}_1,\dots,{f v}_p\}$  is then called a spanning set of the subspace.
- b\*. can we write this subspace as Span  $\{{f v}_1,\dots,{f v}_p\}$  for linearly independent vectors  $\mathbf{v}_1,\dots,\mathbf{v}_p$ ? The set  $\{\mathbf{v}_1,\dots,\mathbf{v}_p\}$  is then called a basis of the subspace.

Problem b is important because it means every vector in the subspace can written as  $c_1\mathbf{v}_1+\dots+c_p\mathbf{v}_p$  . This allows us to calculate with and prove statements about arbitrary vectors in the subspace. Problem b is important because it means every vector in the subspace can be written uniquely as  $c_1\mathbf{v}_1+\cdots+c_p\mathbf{v}_p$  (proof next week,  $\S4.4$ ).

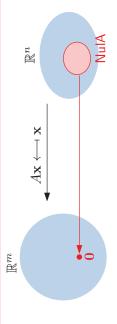

We turn a spanning set into a basis by removing some vectors - this is the

Spanning Set Theorem / casting-out algorithm (p27, also week 7 p10).

Nath 2207 Linear Algebra HKBU Math 2207 Linear Algebra

Remember from p17:

**Definition**: The null space of a  $m \times n$  matrix A, written NulA, is the solution set to the homogeneous equation  $A\mathbf{x} = \mathbf{0}$ .

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 6, Page 22 of 43

NulA is implicitly defined (i.e. defined by conditions) - problem a is easy,

Example: Let 
$$A = \begin{bmatrix} 1 & -3 & 4 & -3 \\ 3 & -7 & 8 & -5 \end{bmatrix}$$
. a. Is  $\mathbf{v} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$  in Nul $A$ ?

b. Find vectors  $\mathbf{v}_1,\dots,\mathbf{v}_p$  which span  $\mathsf{Nul}A$ 

 $x_1 = 2x_3 - 3x_4$ 

a. 
$$A\mathbf{v} = \begin{bmatrix} -1 \\ -1 \end{bmatrix} \neq \mathbf{0}$$
, so  $\mathbf{v}$  is not in Nul $A$ .

b. 
$$[A|0]$$
 row reduction 
$$\begin{bmatrix} 1 & 0 & -2 & 3 & 0 \\ 0 & 1 & -2 & 2 & 0 \end{bmatrix} \xrightarrow{x_3} \xrightarrow{x_3} \xrightarrow{x_3} \xrightarrow{x_3}$$
So the solution 
$$\begin{bmatrix} 2 \\ 2 \\ +t \end{bmatrix} = \begin{bmatrix} -3 \\ 0 \\ -2 \end{bmatrix}$$
 where  $s,t$  can set is  $s = \frac{2}{t} + t = \frac{2}{t} + t = \frac{2}{t} = \frac{2}{t} + t = \frac{2}{t} = \frac{2}{$ 

So the solution 
$$\begin{bmatrix} 2\\2\\1\\0 \end{bmatrix} + t \begin{bmatrix} -3\\-2\\0\\1 \end{bmatrix}$$
 where  $s,t$  can set is 
$$\begin{bmatrix} 2\\1\\0\\1 \end{bmatrix} + t \begin{bmatrix} -1\\0\\0\\1 \end{bmatrix}$$
 take any value.

HKBU Math 2207 Linear Algebra

emester 2 2017, Week 6, Page 23 of 43

linearly independent 🖔

In general: the solution to  $A\mathbf{x} = \mathbf{0}$  in parametric form looks like  $s_i \mathbf{w_i} + s_j \mathbf{w_j} + \dots$ , The vector  $\mathbf{w_i}$  has a 1 in row i and a 0 in row j for every other free variable  $x_j$ , so where  $x_i, x_j, \ldots$  are the free variables (one vector for each free variable)  $\{\mathbf{w_i}, \mathbf{w_j}, \dots\}$  are automatically linearly independent.

b. 
$$[A|0]$$
 row reduction 
$$\begin{bmatrix} 1 & 0 & -2 & 3 & | & 0 \\ 0 & 1 & -2 & 2 & | & 0 \end{bmatrix}$$
So the solution 
$$\begin{bmatrix} 2 \\ 1 \\ 0 \end{bmatrix} + t \begin{bmatrix} -3 \\ 0 \end{bmatrix}$$
 where  $s,t$  can set is 
$$\begin{bmatrix} 2 \\ 1 \\ 0 \end{bmatrix} + t \begin{bmatrix} -3 \\ 0 \end{bmatrix}$$
 where  $s,t$  can linearly independent 
$$\begin{bmatrix} 2 \\ -2 \\ 0 \end{bmatrix} = \begin{bmatrix} -3 \\ 1 \\ 0 \end{bmatrix}$$

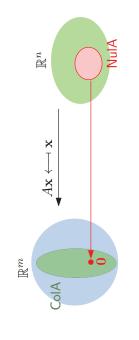

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 6, Page 24 of 43

# **Definition**: The column space of a m imes n matrix A, written $\mathsf{Col}A$ , is the span of the columns of A.

Because spans are subspaces, it is obvious that  $\mathsf{Col} A$  is a subspace of  $\mathbb{R}^m$ 

It follows from §1.3-1.4 that ColA is the set of b for which Ax = b has solutions.

**HKBU Math 2207 Linear Algebra** 

 $\operatorname{Col} A$  is explicitly defined - problem a takes work, problem b is easy.

Example: Let 
$$A = \begin{bmatrix} 0 & 3 & -6 & 6 & 4 \\ 3 & -7 & 8 & -5 & 8 \\ 1 & -3 & 4 & -3 & 2 \end{bmatrix}$$
 a. Is  $\mathbf{v} = \begin{bmatrix} -5 \\ 9 \\ 5 \end{bmatrix}$  in Col $A$ ?

b. By definition, 
$$\operatorname{Col} A$$
 is the span of the columns of  $A$ , so  $\operatorname{Col} A = \operatorname{Span} \left\{ \begin{bmatrix} 0 \\ 1 \end{bmatrix}, \begin{bmatrix} 3 \\ -7 \end{bmatrix}, \begin{bmatrix} 6 \\ 8 \end{bmatrix}, \begin{bmatrix} -5 \\ -3 \end{bmatrix}, \begin{bmatrix} 8 \\ 8 \end{bmatrix}, \begin{bmatrix} -5 \\ -3 \end{bmatrix}, \begin{bmatrix} 8 \\ 8 \end{bmatrix} \right\}$ . Note that this spanning set is not linearly independent (more than 3 vectors in  $\mathbb{R}^3$ ).

emester 2 2017, Week 6, Page 26 of 43

Contrast Between Nul A and Col A for an m x n Matrix A

Semester 2 2017, Week 6, Page 25 of 43

As we saw on p26, it is easy to obtain a spanning set for  ${\sf Col}\,A$  (just take all the columns of A), but usually this spanning set is not linearly independent.

textbook

To obtain a linearly independent set that spans  ${\sf Col}A$ , take the pivot columns of A this is called the casting-out algorithm.

 $\leftarrow$  problem b

Answer: 
$$\begin{bmatrix} 0 & 3 & -6 & 6 & 4 \\ 3 & -7 & 8 & -5 & 8 \\ 1 & -3 & 4 & -3 & 2 \end{bmatrix} \xrightarrow{\text{row reduction}} \begin{bmatrix} 1 & -3 & 4 & 3 & 2 \\ 0 & 1 & -2 & 2 & 1 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

The pivot columns are 1,2 and 5, so  $\{\mathbf{a}_1,\mathbf{a}_2,\mathbf{a}_5\} = \left\{ \begin{bmatrix} 0\\3\\1 \end{bmatrix}, \begin{bmatrix} 3\\-7\\2 \end{bmatrix}, \begin{bmatrix} 4\\8\\2 \end{bmatrix} \right\}$  is one answer. (The answer from the casting-out algorithm is not the only answer - see p34.)

Col A is explicitly defined; that is, you are told how to build vectors in Col A. and the entries in A, since each column of A typical vector v in Col A has the property There is an obvious relation between Col A It is easy to find vectors in Col A. that the equation  $A\mathbf{x} = \mathbf{v}$  is consistent A is in Col A. 2. Nul A is implicitly defined; that is, you are There is no obvious relation between Nul  ${\cal A}$  and the entries in  ${\cal A}$ . Given a specific vector **v**, it is easy to tell if **v** is in Nul A. Just compute Av. A typical vector v in Nul A has the property that Av = 0. given only a condition (Ax = 0) that vecoperations on [A | 0] are required. 1. Nul A is a subspace of R"

Given a specific vector  $\mathbf{v}$ , it may take time to tell if  $\mathbf{v}$  is in Col A. Row operations on  $Col A = \mathbb{R}^m$  if and only if the linear tran  $Col A = \mathbb{R}^m$  if and only if the equation formation  $x \mapsto Ax$  maps  $\mathbb{R}^n$  onto  $\mathbb{R}^m$ . A v are required. Nul  $A = \{0\}$  if and only if the linear trans Nul  $A = \{0\}$  if and only if the equation formation  $x \mapsto Ax$  is one-to-one

eek 6, Page 27 of 43  $\leftarrow$  problem a

Why does the casting-out algorithm work part 1: why the pivot columns are linearly independent:

Semester 2 2017, Week 6, Page 29 of 43

**HKBU Math 2207 Linear Algebra** 

Casting-out algorithm: the pivot columns of 
$$A$$
 is a linearly independent set that spans  ${\sf Col}\,A$ .

Why does the casting-out algorithm work part 2: why the pivot columns span ColA:

To explain this, we need to look at the solutions to  $A\mathbf{x} = 0$ :

These correspond respectively to the linear dependence relations

$$2a_1 + 2a_2 + a_3 = 0$$
 and  $-3a_1 - 2a_2 + a_4 = 0$ .

Semester 2 2017, Week 6, Page 30 of 43 Rearranging:  $\mathbf{a}_3 = -2\mathbf{a}_1 - 2\mathbf{a}_2$  and  $\mathbf{a}_4 = 3\mathbf{a}_1 + 2\mathbf{a}_2$ . HKBU Math 2207 Linear Algebra

Another view: the casting-out algorithm as a greedy algorithm:

 $\mathbf{a}_3 = -2\mathbf{a}_1 - 2\mathbf{a}_2.$ 

In other words: consider the solution to  $A\mathbf{x} = \mathbf{0}$  where one free variable  $x_i$  is 1, and

 $A(-3, -2, 0, 1, 0) = 0 \longrightarrow -3a_1 - 2a_2 + a_4 = 0 \longrightarrow a_4 = 3a_1 + 2a_2.$ 

 $2\mathbf{a}_1 + 2\mathbf{a}_2 + \mathbf{a}_3 = \mathbf{0}$ 

**A** 

 $A(2, 2, 1, 0, 0) = \mathbf{0}$ 

among the columns of A, which can be rearranged to express the column  $\mathbf{a}_i$  as

Why this is useful: any vector  ${\bf v}$  in ColA has the form

inear combination of the pivot columns.

 $\mathbf{v} = c_1 \mathbf{a}_1 + c_2 \mathbf{a}_2 + c_3 \mathbf{a}_3 + c_4 \mathbf{a}_4 + c_5 \mathbf{a}_5,$ 

which we can rewrite as

all other free variables are 0. This corresponds to a linear dependence relation

$$\begin{bmatrix} | & | & | & | & | & | \\ a_1 & a_2 & a_3 & a_4 & a_5 \\ | & | & | & | & | \end{bmatrix} = \begin{bmatrix} 0 & 3 & -6 & 6 & 4 \\ 3 & -7 & 8 & -5 & 8 \\ 1 & -3 & 4 & -3 & 2 \end{bmatrix} \xrightarrow{\text{row reduction}} \begin{bmatrix} 1 & 0 & -2 & 3 & 0 \\ 0 & 1 & -2 & 2 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

HKBU Math 2207 Linear Algebra

HKBU Math 2207 Linear Algebra

and so  $\mathsf{Col} A = \mathsf{Span} \left\{ \mathbf{a}_1, \mathbf{a}_2, \mathbf{a}_5 \right\}$ 

Semester 2 2017, Week 6, Page 31 of 43

remove  $\mathbf{a}_3$ .

 $= (c_1 - 2c_3 + 3c_4)\mathbf{a}_1 + (c_2 - 2c_3 + 2c_4)\mathbf{a}_2 + c_5\mathbf{a}_5,$  a linear combination of the pivot columns  $\mathbf{a}_1, \mathbf{a}_2, \mathbf{a}_5$ . So  $\mathbf{v}$  is in Span  $\{\mathbf{a}_1, \mathbf{a}_2, \mathbf{a}_5\}$ ,

 $c_1\mathbf{a}_1 + c_2\mathbf{a}_2 + c_3(-2\mathbf{a}_1 - 2\mathbf{a}_2) + c_4(3\mathbf{a}_1 + 2\mathbf{a}_2) + c_5\mathbf{a}_5$ 

Semester 2 2017, Week 6, Page 32 of 43

$$\operatorname{rref}\left(\begin{bmatrix} | & | & | & | \\ \mathbf{a}_1 \ \mathbf{a}_2 \ \mathbf{a}_4 \end{bmatrix}\right) = \begin{bmatrix} 1 & 0 & 3 \\ 0 & 1 & 2 \\ 0 & 0 & 0 \end{bmatrix} \quad \begin{cases} \text{does not have a pivot in every column, so } \\ \left\{ \begin{bmatrix} | & | & | & | \\ | & | & | & | \\ \end{array} \right\} \right) = \begin{bmatrix} 1 & 0 & 3 \\ 0 & 1 & 2 \\ 0 & 0 & 0 \end{bmatrix} \quad \begin{cases} \mathbf{a}_1, \mathbf{a}_2, \mathbf{a}_4 \\ \mathbf{a}_1, \mathbf{a}_2, \mathbf{a}_4 \end{cases} \text{ is linearly dependent, so we remove } \mathbf{a}_4.$$

**HKBU Math 2207 Linear Algebra** 

Semester 2 2017, Week 6, Page 33 of 43

So the casting-out algorithm is a greedy algorithm in that it prefers vectors that

are earlier in the set.   
**Example**: Let 
$$A = \begin{bmatrix} | & | & | & | & | & | \\ a_1 & a_2 & a_3 & a_4 & a_5 \\ | & | & | & | & | & | \end{bmatrix} = \begin{bmatrix} 0 & 3 & -6 & 6 & 4 \\ 3 & -7 & 8 & -5 & 8 \\ 1 & -3 & 4 & -3 & 2 \end{bmatrix}$$
Find a linearly independent set containing a<sub>3</sub> that spans Col*A*.

**Answer**: To ensure that the set contains 
$$a_3$$
, we should make it the leftmost column - e.g. we row-reduce  $\begin{bmatrix} 1 & 1 & 1 \\ a_3 & a_1 & a_2 \\ 1 & 1 & 1 \end{bmatrix}$  and take the pivot columns.

**Warning**: the example on the previous two pages is a little misleading: a subset of the columns of rref(
$$A$$
) is not always the reduced echelon form of those columns of  $A$ , e.g.rref 
$$\begin{bmatrix} 1 & 1 \\ 2 & 3 \\ 2 & 4 \end{bmatrix} \neq \begin{bmatrix} 0 & -2 \\ 1 & -2 \\ 0 & 0 \end{bmatrix}$$
 (because this isn't in reduced echelon form). The correct statement is that a subset of the columns of rref( $A$ ) is row equivalent

to those columns of A. HKBU Math 2207 Linear Algebra

Theorem 13: Row operations do not change the row space. In particular, the nonzero rows of  $\operatorname{rref}(A)$  is a linearly independent set whose span is  $\operatorname{\mathsf{Row}} A$ 

**Definition**: The row space of a  $m \times n$  matrix A, written RowA, is the span of the

rows of A. It is a subspace of  $\mathbb{R}^n$ .

 $\mathsf{Row} A = \mathsf{Span}\,\{(0,1,0,4),(0,2,0,8),(1,2,-3,6)\}.$ 

RowA is explicitly defined - indeed, it is equivalent to  $\mathsf{Col}A^T$ .

So, to see if a vector  ${f v}$  is in RowA, row-reduce  $[A^T|{f v}^T]$ 

$$A = \begin{bmatrix} 0 & 1 & 0 & 4 \\ 0 & 2 & 0 & 8 \\ 1 & 2 & -3 & 6 \end{bmatrix} \quad \begin{bmatrix} 0 & 1 & 0 & 4 \\ R_2 - 2R_1 \begin{bmatrix} 0 & 0 & 0 & 0 \\ 1 & 0 & -3 & -2 \end{bmatrix} \quad \text{rref}(A) = \begin{bmatrix} 1 & 0 & -3 & -2 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$(1,4,-3,14)=R_2+R_3=(R_2-2R_1)+(R_3-R_1)+3R_1$$
 Similarly, any linear combination of  $R_1,R_2,R_3$  can be written as a linear

combination of  $R_1, R_2 - 2R_1, R_3 - R_1$ . To find a linear independent set that spans RowA, take the pivot columns of  $A^T$ , or..

Theorem 13: Row operations do not change the row space. In particular, the

nonzero rows of rref(A) is a linearly independent set whose span is RowA. E.g. for the above example,  $Row A = Span\{(1,0,-3,-2),(0,1,0,4)\}$ 

Warning: the "pivot rows" of A do not usually span  ${\sf Row}A$ :

e.g. here (1,2,-3,6) is in RowA but not in Span  $\{(0,1,0,4),(0,2,0,8)\}$ 

HKBU Math 2207 Linear Algebra

Proof of the second sentence in Theorem 13:

 $\mathsf{rref}(A)$ . Because each nonzero row has a 1 in one pivot column (different column From the first sentence,  $\operatorname{Row}(A) = \operatorname{Row}(\operatorname{rref}(A)) = \operatorname{Span}$  of the nonzero rows of for each row) and 0s in all other pivot columns, these rows are linearly

HKBU Math 2207 Linear Algebra

### Summary:

A basis for W is a linearly independent set that spans W (more later)

- NulA=solutions to  $A\mathbf{x} = \mathbf{0}$ ,
- ColA=span of columns of A,
- RowA=span of rows of A.
- basis for NulA: solve  $A\mathbf{x} = \mathbf{0}$  via the rref.
  - basis for  $\operatorname{Col} A$ : pivot columns of A.
- basis for RowA: nonzero rows of rref(A).

ColA is in  $\mathbb{R}^m$ .

 $\operatorname{Nul} A$ ,  $\operatorname{Row} A$  are in  $\mathbb{R}^n$ .

In general,  $\operatorname{Col}(\operatorname{rref}(A))$ .

 $\mathsf{Nul} A = \mathsf{Nul}(\mathsf{rref}(A)), \ \mathsf{Row} A = \mathsf{Row}(\mathsf{rref}(A)).$ 

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 6, Page 37 of 43

**Definition**: A function  $T:V \to W$  is a linear transformation if:

- 1.  $T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$  for all  $\mathbf{u}, \mathbf{v}$  in V;
- 2.  $T(c\mathbf{u}) = cT(\mathbf{u})$  for all scalars c and for all  $\mathbf{u}$  in V

Example: The differentiation function  $D:\mathbb{P}_n o\mathbb{P}_{n-1}$  given by  $D(\mathbf{p})=rac{d}{dt}\mathbf{p},$ 

$$D(a_0 + a_1t + a_2t^2 + \dots + a_nt^n) = a_1 + 2a_2t + \dots + na_nt^{n-1},$$

If you've taken a calculus class, then you already know this: you're really thinking When you calculate

 $3\frac{d}{dt}x + 2\frac{d}{dt}x^2$  $\frac{d}{dt}(3x + 2x^2) = 3 + 2 \cdot 2x$ 

Method A to show that D is linear:

$$D(\mathbf{p} + \mathbf{q}) = \frac{d}{dt}(\mathbf{p} + \mathbf{q}) = \frac{d}{dt}\mathbf{p} + \frac{d}{dt}\mathbf{q} = D(\mathbf{p}) + D(\mathbf{q}); \text{ and}$$

HKBU Math 2207 Linear Algebra  $= \frac{d}{dt}(c\mathbf{p}) = c\frac{d}{dt}\mathbf{p}$ 

 $=cD(\mathbf{p})$ Semester 2 2017, Week 6, Page 39 of 43

# PP222-223: Linear Transformations for Vector Spaces

Recall (week 3  $\S 1.8)$  the definition of a linear transformation:

**Definition**: A function  $T:\mathbb{R}^n \to \mathbb{R}^m$  is a linear transformation if:

- 1.  $T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$  for all  $\mathbf{u}, \mathbf{v}$  in the domain of T;
- 2.  $T(c\mathbf{u}) = cT(\mathbf{u})$  for all scalars c and for all  $\mathbf{u}$  in the domain of T.

Now consider a function  $T:V\to W$ , where V,W are abstract vector spaces. Because we can add and scalar-multiply in  ${\cal V}$ , the left hand sides of the equations in 1,2 make sense.

Because we can add and scalar-multiply in  ${\cal W},$  the right hand sides of the equations in 1,2 make sense.

So we can ask if functions between abstract vector spaces are linear: **Definition**: A function  $T:V \to W$  is a linear transformation if:

1.  $T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$  for all  $\mathbf{u}, \mathbf{v}$  in V;

- 2.  $T(c\mathbf{u}) = cT(\mathbf{u})$  for all scalars c and for all  $\mathbf{u}$  in V.

Hard exercise: show that the set of all linear transformations V o W is a vector space. (BU Math 2207 Linear Algebra HKBU Math 2207 Linear Algebra

**Definition**: A function  $T:V \to W$  is a linear transformation if:

- 1.  $T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$  for all  $\mathbf{u}, \mathbf{v}$  in V;
- 2.  $T(c\mathbf{u}) = cT(\mathbf{u})$  for all scalars c and for all  $\mathbf{u}$  in V.

**Example**: The differentiation function  $D:\mathbb{P}_n o \mathbb{P}_{n-1}$  given by  $D(\mathbf{p})=rac{d}{dt}\mathbf{p}$ ,  $D(a_0 + a_1t + a_2t^2 + \dots + a_nt^n) = a_1 + 2a_2t + \dots + na_nt^{n-1},$ 

 $D((a_0 + b_0) + (a_1 + b_1)t + (a_2 + b_2)t^2 + \dots + (a_n + b_n)t^n)$  $= a_1 + 2a_2t + \dots + na_nt^{n-1} + b_1 + 2b_2t + \dots + nb_nt^{n-1}$ Method B to show that D is linear - use the formula:  $= (a_1 + b_1) + 2(a_2 + b_2)t + \dots + n(a_n + b_n)t^{n-1}$ 

 $D((ca_0) + (ca_1)t + (ca_2)t^2 + \dots + (ca_n)t^n) = (ca_1) + 2(ca_2)t + \dots + n(ca_n)t^{n-1}$  $= D(a_0 + a_1t + a_2t^2 + \cdots + a_nt^n) + D(b_0 + b_1t + b_2t^2 + \cdots + b_nt^n);$  and

 $=cD(a_0+a_1t+a_2t^2+\cdots+a_nt^n)$ . Semester 2 2017, Week 6, Page 40 of 43  $= c(a_1 + 2a_2t + \dots + na_nt^{n-1})$ 

HKBU Math 2207 Linear Algebra

**Example**: The "multiplication by t" function  $M:\mathbb{P}_n \to \mathbb{P}_{n+1}$  given by  $M(\mathbf{p}(t)) = t\mathbf{p}(t),$ 

$$M(a_0 + a_1t + \dots + a_nt^n) = t(a_0 + a_1t + \dots + a_nt^n),$$

Method A: 
$$M(\mathbf{p}+\mathbf{q})=t[(\mathbf{p}+\mathbf{q})(t)]=t\mathbf{p}(t)+t\mathbf{q}(t)=M(\mathbf{p})+M(\mathbf{q});$$
 and  $M(c\mathbf{p})=t[(c\mathbf{p})(t)]=c[t(\mathbf{p}(t)]=c[t(\mathbf{p}(t))]$ 

 $M((ca_0) + (ca_1)t + \dots + (ca_n)t^n) = t((ca_0) + (ca_1)t + \dots + (ca_n)t^n)$  $= M(a_0 + a_1t + \cdots + a_nt^n) + M(b_0 + b_1t + \cdots + b_nt^n);$  and  $= ct(a_0 + a_1t + \dots + a_nt^n)$  $= t(a_0 + a_1t + \dots + a_nt^n) + t(a_0 + a_1t + \dots + a_nt^n)$ Method B:  $M((a_0+b_0)+(a_1+b_1)t+\cdots+(a_n+b_n)t^n)$  $= t(a_0 + b_0) + (a_1 + b_1)t + \dots + (a_n + b_n)t^n)$ 

HKBU Math 2207 Linear Algebra

 $= cM(a_0 + a_1t + \dots + a_nt^n).$ Semester 2 2017, Week 6, Page 41 of 43

with  $\mathbf{p}(2)=0$ . We show that Q is a subspace of  $\mathbb{P}_3$  by showing that it is the kernel of a linear transformation. (This argument is hard; if you prefer the axiom-checking Redo Example: (p12) Let Q be the set of polynomials  $\mathbf{p}(t)$  of degree at most 3on p12 that is fine.)

The evaluation-at-2 function  $E_2:\mathbb{P}_3 o\mathbb{R}$  given by  $E_2(\mathbf{p})=\mathbf{p}(2),$ 

$$E_2(a_0 + a_1t + a_2t^2 + a_3t^3) = a_0 + a_12 + a_22^2 + a_32^3$$

is a linear transformation because

1. For  $\mathbf{p}, \mathbf{q}$  in  $\mathbb{P}_3$ , we have

$$E_2(\mathbf{p} + \mathbf{q}) = (\mathbf{p} + \mathbf{q})(2) = \mathbf{p}(2) + \mathbf{q}(2) = E_2(\mathbf{p}) + E_2(\mathbf{q}).$$

2. For  $\mathbf{p}$  in  $\mathbb{P}_3$  and any scalar c, we have  $E_2(c\mathbf{p})=(c\mathbf{p})(2)=c(\mathbf{p}(2))=cE_2(\mathbf{p})$ So  $E_2$  is a linear transformation. Q is the kernel of  $E_2$ , so Q is a subspace. Can we write Q as Span  $\{\mathbf{p}_1,\dots,\mathbf{p}_p\}$  for some linearly independent polynomials  $\mathbf{p}_1,\dots,\mathbf{p}_p$ ?

One idea: associate a matrix A to  $E_2$  and take a basis of NulA using the rref. To do computations like this, we need coordinates.

HKBU Math 2207 Linear Algebra

**Definition**: A function  $T:V \to W$  is a linear transformation if:

- 1.  $T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$  for all  $\mathbf{u}, \mathbf{v}$  in V;
- 2.  $T(c\mathbf{u}) = cT(\mathbf{u})$  for all scalars c and for all  $\mathbf{u}$  in V.

The concepts of kernel and range (week 3,  $\S1.9)$  make sense for linear

**Definition**: The *kernel* of T is the set of  ${\bf v}$  in V satisfying  $T({\bf v})={\bf 0}$ . transformations between abstract vector spaces:

**Definition**: The range of T is the set of  $\mathbf{w}$  in W such that  $\mathbf{w} = T(\mathbf{v})$  for some  $\mathbf{v}$ 

 $D(\mathbf{p})=rac{d}{dt}\mathbf{p}$ , is the set of constant polynomials  $\mathbf{p}(t)=a_0$  for any number  $a_0.$ **Example**: The kernel of the differentiation function  $D: \mathbb{P}_n \to \mathbb{P}_{n-1}$ , given by The range of D is all of  $\mathbb{P}_{n-1}.$  Our proof that null spaces are subspaces (p18) shows that the kernel of a linear transformation is a subspace.

Exercise: show that the range of a linear transformation is a subspace.

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 6, Page 42 of 43

Semester 2 2017, Week 6, Page 43 of 43
