Fact: A linear system has either

- exactly one solution
- infinitely many solutions
- no solutions

We gave an algebraic proof via row reduction, but the picture, although not a proof, is useful for understanding this fact.

**EXAMPLE** Two equations in two variables:

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 2, Page 1 of 43

Now we will think more geometrically about linear systems.

- §1.3-1.4 Span related to existence of solutions
- §1.5 A geometric view of solution sets (a detour)
- §1.7 Linear independence related to uniqueness of solutions

We are aiming to understand the two key concepts in three ways

- The related computations: to solve problems about a specific linear system with numbers (p13-14, p37-38).
- The rigorous definition: to prove statements about an abstract linear system (p39-40).
- The conceptual idea: to guess whether statements are true, to develop a plan for a proof or counterexample, and to help you remember the main theorems (p11-12, p33-34).

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 2, Page 2 of 43

## §1.3: Vector Equations

A column vector is a matrix with only one column.

Until Chapter 4, we will say "vector" to mean "column vector"

A vector 
$${\bf u}$$
 is in  $\mathbb{R}^n$  if it has  $n$  rows, i.e.  ${\bf u}=egin{bmatrix}u_1\\\vdots\\u_n\end{bmatrix}$ 

**Example**:  $\begin{vmatrix} 1 \\ 3 \end{vmatrix}$  and  $\begin{vmatrix} 2 \\ 1 \end{vmatrix}$  are vectors in  $\mathbb{R}^2$ .

Vectors in  $\mathbb{R}^2$  and  $\mathbb{R}^3$  have a geometric meaning: think of  $\left| rac{x}{y} 
ight|$  as the point (x,y)

 $cu_1$ 

 $u_1 + v_1$ 

 $\begin{bmatrix} u_1 \\ u_2 \\ \vdots \end{bmatrix}$  and  $\mathbf{v} = \begin{bmatrix} v_1 \\ v_2 \\ \vdots \end{bmatrix}$  , then  $\mathbf{u} + \mathbf{v} = \mathbf{v}$ 

addition: if  $\mathbf{u}=$ 

There are two operations we can do on vectors:

and c is a number (a scalar), then  $c\mathbf{u} =$ 

scalar multiplication: if  ${f u}=$ 

 $= 0 = \mathbf{n}0$  $\mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u}, \quad c(\mathbf{u} + \mathbf{v}) = c\mathbf{u} + c\mathbf{v},$ 

These satisfy the usual rules for arithmetic of numbers, e.g.

HKBU Math 2207 Linear Algebra

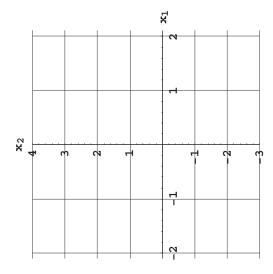

Semester 2 2017, Week 2, Page 4 of 43

HKBU Math 2207 Linear Algebra

in the plane.

If **u** and **v** in  $\mathbb{R}^2$  are represented as points in the plane, then  $\mathbf{u} + \mathbf{v}$  corresponds to the fourth vertex of the parallelogram whose other vertices are **0**, **u** and **v**. (Note that  $\mathbf{0} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$ .)

**EXAMPLE:** Let 
$$\mathbf{u} = \begin{bmatrix} 1 \\ 3 \end{bmatrix}$$
 and  $\mathbf{v} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$ 

Combining the operations of addition and scalar multiplication: **Definition**: Given vectors  $\mathbf{v}_1, \mathbf{v}_2, \dots \mathbf{v}_p$  in  $\mathbb{R}^n$  and scalars  $c_1, c_2, \dots c_p$ , the vector

$$c_1\mathbf{v}_1 + c_2\mathbf{v}_2 + \dots + c_p\mathbf{v}_p$$

is a linear combination of  $\mathbf{v}_1, \mathbf{v}_2, \dots \mathbf{v}_p$  with weights  $c_1, c_2, \dots c_p$ .

**Example**: 
$$\mathbf{u} = \begin{bmatrix} 1 \\ 3 \end{bmatrix}$$
,  $\mathbf{v} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$ . Some linear combinations of  $\mathbf{u}$  and  $\mathbf{v}$  are:

$$3\mathbf{u} + 2\mathbf{v} = \begin{bmatrix} 7\\11 \end{bmatrix}.$$

$$\frac{1}{3}\mathbf{u} + 0\mathbf{v} = \begin{bmatrix} 1/3 \\ 1 \end{bmatrix}.$$

$$\mathbf{u} - 3\mathbf{v} = \begin{bmatrix} -3 \\ 0 \end{bmatrix}.$$

$$\mathbf{0} = 0 + 0 = \mathbf{0}$$

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 2, Page 7 of 43

Geometric interpretation of linear combinations: all the points you can go to if you are only allowed to move in the directions of  ${\bf v}_1,\dots,{\bf v}_p$ .

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 2, Page 8 of 43

EXAMPLE: Let 
$$\mathbf{v}_1 = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$
 and  $\mathbf{v}_2 = \begin{bmatrix} -2 \\ 2 \end{bmatrix}$ . Express each of the following as a linear combination of  $\mathbf{v}_1$  and  $\mathbf{v}_2$ :

$$\mathbf{a} = \begin{bmatrix} 0 \\ 3 \end{bmatrix}, \ \mathbf{b} = \begin{bmatrix} -4 \\ 1 \end{bmatrix}, \ \mathbf{c} = \begin{bmatrix} 6 \\ 6 \end{bmatrix}, \ \mathbf{d} = \begin{bmatrix} 7 \\ -4 \end{bmatrix}$$

$$\mathbf{x}_2$$

$$\mathbf{a} = \begin{bmatrix} -4 \\ 5 \end{bmatrix}, \ \mathbf{d} = \begin{bmatrix} 7 \\ -4 \end{bmatrix}$$

**Definition**: Suppose  $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_p$  are in  $\mathbb{R}^n$ . The span of  $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_p$ , written

$$\mathsf{Span}\left\{\mathbf{v}_1,\mathbf{v}_2,\ldots,\mathbf{v}_p\right\},$$

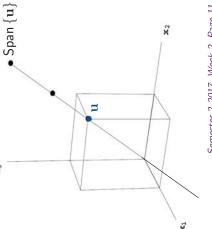

is the set of all linear combinations of  $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_p.$ 

In other words, Span  $\{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_p\}$  is the set of all vectors which can be written as  $x_1\mathbf{v}_1 + x_2\mathbf{v}_2 + \dots + x_p\mathbf{v}_p$  for any choice of weights  $x_1, x_2, \dots, x_p$ .

**Example**: Span of one vector in  $\mathbb{R}^3$ 

- Span  $\{0\} = \{0\}$ , because c0 = 0 for all scalars c.
- $\bullet\,$  If  ${\bf u}$  is not the zero vector, through the origin in the then Span  $\{\mathbf{u}\}$  is a line direction **u**.

We can also say " $\{\mathbf{u}\}$  spans a line through the origin".

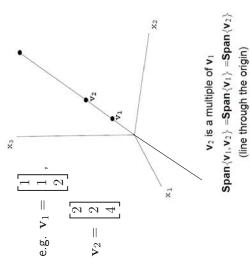

Semester 2 2017, Week 2, Page 11 of 43

HKBU Math 2207 Linear Algebra

HKBU Math 2207 Linear Algebra Semester 2 2017, Week 2, Page 10 of 43

**Example**: Span of two vectors in  $\mathbb{R}^3$ 

e.g.  $\mathbf{v}_1 = \begin{bmatrix} 3 \\ 1 \end{bmatrix}$ ,  $\mathbf{v}_2 = \begin{bmatrix} 4 \\ 4 \end{bmatrix}$ 

spanned by  $\{\mathbf{v}_1, \mathbf{v}_2\}$ . Span  $\{v_1, v_2\}$  =plane through the origin v2 is not a multiple of v1

This is the plane

Semester 2 2017, Week 2, Page 12 of 43

HKBU Math 2207 Linear Algebra

**EXAMPLE:** Let 
$$\mathbf{a}_1 = \begin{bmatrix} 4 \\ 2 \\ 14 \end{bmatrix}$$
,  $\mathbf{a}_2 = \begin{bmatrix} 3 \\ 6 \\ 10 \end{bmatrix}$ , and  $\mathbf{b} = \begin{bmatrix} -2 \\ 8 \\ -8 \end{bmatrix}$ . Determine if  $\mathbf{b}$  is a linear combination of  $\mathbf{a}_1$  and  $\mathbf{a}_2$ .

**Solution:** Vector **b** is a linear combination of  $\mathbf{a}_1$  and  $\mathbf{a}_2$  if we can find weights  $x_1, x_2$  such that

$$x_1$$
**a**<sub>1</sub> +  $x_2$ **a**<sub>2</sub> = **b**.

Vector equation:

Corresponding linear system:

Corresponding augmented matrix:

From the previous example, we see that the vector equation

$$x_1\mathbf{a}_1 + x_2\mathbf{a}_2 + \dots + x_p\mathbf{a}_p = \mathbf{b}$$

has the same solution set as the linear system whose augmented matrix is

$$egin{bmatrix} -1 & -1 & -1 & -1 \ a_1 & a_2 & \cdots & a_p & \mathbf{b} \ -1 & -1 & -1 & -1 \end{bmatrix}.$$

In particular, **b** is a linear combination of  $\mathbf{a}_1, \mathbf{a}_2, \dots, \mathbf{a}_p$  (i.e. **b** is in Span  $\{\mathbf{a}_1, \mathbf{a}_2, \dots, \mathbf{a}_p\}$ ) if and only if there is a solution to the linear system with augmented matrix

Semester 2 2017, Week 2, Page 14 of 43 We now develop a different way to write this equation.

## $\S 1.4$ : The Matrix Equation $A\mathbf{x} = \mathbf{b}$ We can think of the weights $x_1, x_2, \dots, x_p$ as a vector.

$$\neg m$$
 rows,  $p$  columns

The product of an  $m \times p$  matrix A and a vector  ${\bf x}$  in  $\mathbb{R}^p$  is the linear combination of the columns of A using the entries of  ${\bf x}$  as weights:

$$A\mathbf{x} = \begin{bmatrix} | & | & | & | \\ \mathbf{a}_1 & \mathbf{a}_2 & \dots & \mathbf{a}_p \end{bmatrix} \begin{bmatrix} x_1 \\ \vdots \\ x_p \end{bmatrix} = x_1\mathbf{a}_1 + x_2\mathbf{a}_2 + \dots + x_p\mathbf{a}_p.$$

Example: 
$$\begin{bmatrix} 4 & 3 \\ 2 & 6 \\ 14 & 10 \end{bmatrix} \begin{bmatrix} -2 \\ 2 \end{bmatrix} = -2 \begin{bmatrix} 4 \\ 2 \\ 14 \end{bmatrix} + 2 \begin{bmatrix} 3 \\ 6 \\ 10 \end{bmatrix} = \begin{bmatrix} -2 \\ 8 \\ -8 \end{bmatrix}.$$

Semester 2 2017, Week 2, Page 15 of 43

There is another way to compute  $A\mathbf{x}$ , one row of A at a time:

Example: 
$$\begin{bmatrix} 4 & 3 \\ 2 & 6 \\ 14 & 10 \end{bmatrix} \begin{bmatrix} -2 \\ 2 \end{bmatrix} = \begin{bmatrix} 4(-2) + 3(2) \\ 2(-2) + 6(2) \\ 14(-2) + 10(2) \end{bmatrix} = \begin{bmatrix} -2 \\ 8 \\ -8 \end{bmatrix}.$$

the number of rows of x. The number of rows of  $A\mathbf{x}$  is the number of rows of A. Warning: The product  $A\mathbf{x}$  is only defined if the number of columns of A equals

It is easy to check that  $A(\mathbf{u} + \mathbf{v}) = A\mathbf{u} + A\mathbf{v}$  and  $A(c\mathbf{u}) = cA\mathbf{u}$ .

**HKBU Math 2207 Linear Algebra** 

Semester 2 2017, Week 2, Page 16 of 43

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 2, Page 17 of 43

So these three things are the same:

1. The system of linear equations with augmented matrix  $[A|\mathbf{b}]$  has a solution, 2. b is a linear combination of the columns of A (or b is in the span of the

- columns of A),
- 3. The matrix equation  $A\mathbf{x} = \mathbf{b}$  has a solution.

vectors  ${\bf b}$  in  $\mathbb{R}^m$ ? i.e. when is  $A{\bf x}={\bf b}$  consistent for all right hand sides  ${\bf b}$ , and One question of particular interest: when are the above statements true for all

when is Span 
$$\{a_1,a_2,\ldots,a_p\}=\mathbb{R}^m$$
? Example:  $(m=3)$  Let  $\mathbf{e}_1=\begin{bmatrix}1\\0\\0\end{bmatrix}$ ,  $\mathbf{e}_2=\begin{bmatrix}0\\1\\0\end{bmatrix}$ ,  $\mathbf{e}_3=\begin{bmatrix}0\\0\\1\end{bmatrix}$ .  $\mathbf{e}_3=\begin{bmatrix}0\\0\\1\end{bmatrix}$ . Then Span  $\{\mathbf{e}_1,\mathbf{e}_2,\mathbf{e}_3\}=\mathbb{R}^3$ , because  $\begin{bmatrix}x\\y\\z\end{bmatrix}=x\begin{bmatrix}1\\0\\0\end{bmatrix}+y\begin{bmatrix}0\\1\\0\end{bmatrix}+z\begin{bmatrix}0\\0\\1\end{bmatrix}$ . But for a more complicated set of vectors, the weights will be more complicated

functions of x,y,z. So we want a better way to answer this question.

Semester 2 2017, Week 2, Page 18 of 43

We have three ways of viewing the same problem:

- The system of linear equations with augmented matrix  $[A|\mathbf{b}]$ , 1. The system of linear equations 2. The vector equation  $x_1\mathbf{a}_1 + x_2$  3. The matrix equation  $A\mathbf{x} = \mathbf{b}$ .
  - The vector equation  $x_1\mathbf{a}_1 + x_2\mathbf{a}_2 + \cdots + x_p\mathbf{a}_p = \mathbf{b}$ ,

- So these three things are the same: 1. The system of linear equations with augmented matrix  $[A|\mathbf{b}]$  has a solution, 2.  $\mathbf{b}$  is a linear combination of the columns of A (or  $\mathbf{b}$  is in the span of the columns of A),
  - 3. The matrix equation  $A\mathbf{x} = \mathbf{b}$  has a solution.

(In fact, the three problems have the same solution set.)

Another way of saying this: The span of the columns of  ${\cal A}$  is the set of vectors b for which  $A\mathbf{x} = \mathbf{b}$  has a solution.

A, the following statements are logically equivalent (i.e. for any particular matrix A, they are all true or all false): Theorem 4: Existence of solutions to linear systems: For an  $m \times n$  matrix

- a. For each b in  $\mathbb{R}^m$ , the equation  $A\mathbf{x} = \mathbf{b}$  has a solution.
- Each  $\mathbf{b}$  in  $\mathbb{R}^m$  is a linear combination of the columns of A.
- The columns of A span  $\mathbb{R}^m$  (i.e. Span  $\{\mathbf{a}_1,\mathbf{a}_2,\dots,\mathbf{a}_p\}=\mathbb{R}^m$ ). c. The columns of A span  $\mathbb{R}^{m}$  (i.e. d. rref(A) has a pivot in every row.

Warning: the theorem says nothing about the uniqueness of the solution.

 ${\bf Proof}$ : (outline): By previous the discussion, (a), (b) and (c) are logically equivalent. So, to finish the proof, we only need to show that (a) and (d) are logically equivalent, i.e. we need to show that,

- if (d) is true, then (a) is true;if (d) is false, then (a) is false.

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 2, Page 19 of 43

- a. For each  $\mathbf{b}$  in  $\mathbb{R}^m$ , the equation  $A\mathbf{x} = \mathbf{b}$  has a solution.
- d. rref(A) has a pivot in every row.

Proof: (continued)

row-reduces to  $[\operatorname{rref}(A)|\mathbf{d}]$  for some  $\mathbf{d}$  in  $\mathbb{R}^m$ . This does not have a row of the Suppose (d) is true. Then, for every  ${f b}$  in  $\mathbb{R}^m$ , the augmented matrix  $[A|{f b}]$ form  $[0 \dots 0]*]$ , so, by the Existence of Solutions Theorem (Week 1 p 25),  $4\mathbf{x} = \mathbf{b}$  is consistent. So (a) is true. Suppose (d) is false. We want to find a counterexample to (a): i.e. we want to find a vector  $\mathbf{b}$  in  $\mathbb{R}^m$  such that  $A\mathbf{x} = \mathbf{b}$  has no solution.

Now we apply the row operations in reverse to get an equivalent linear system  $[A|\mathbf{b}]$  that is inconsistent.

 $\begin{bmatrix} 1 & -3 & 1 \\ -2 & 6 & -1 \end{bmatrix} \xrightarrow{R_2 \to R_2 + 2R_1 \setminus \{1 \ 0 \ 0 \ 1\}} \begin{bmatrix} 1 & -3 & 1 \\ 0 & 0 & 1 \end{bmatrix}$ 

Example:

Then the linear system with augmented matrix  $[\operatorname{rref}(A)|\mathbf{d}]$  is

inconsistent.

 $\begin{bmatrix} 1 \\ \end{bmatrix}$  Let  $\mathbf{d} = \begin{bmatrix} \vdots \\ \vdots \end{bmatrix}$ .

**Proof**: (continued) Suppose (d) is false. We want to find a counterexample to (a): i.e. we want to find a vector  $\mathbf{b}$  in  $\mathbb{R}^m$  such that  $A\mathbf{x} = \mathbf{b}$  has no solution.

a. For each  $\mathbf{b}$  in  $\mathbb{R}^m$ , the equation  $A\mathbf{x} = \mathbf{b}$  has a solution.

d. rref(A) has a pivot in every row.

rref(A) does not have a pivot in every row, so its last row is  $[0\dots 0]$ 

Semester 2 2017, Week 2, Page 20 of 43

Semester 2 2017, Week 2, Page 21 of 43

HKBU Math 2207 Linear Algebra

HKBU Math 2207 Linear Algebra

§1.5: Solution Sets of Linear Systems

Goal: use vector notation to give geometric descriptions of solution sets to compare the solution sets of  $A\mathbf{x} = \mathbf{b}$  and of  $A\mathbf{x} = \mathbf{0}$ . Definition: A linear system is homogeneous if the right hand side is the zero

$$A\mathbf{x} = \mathbf{0}$$
.

When we row-reduce [A|0], the right hand side stays 0, so the reduced echelon form does not have a row of the form [0...0|\*] with  $* \neq 0$ . So a homogeneous system is always consistent.

In fact,  ${f x}={f 0}$  is always a solution, because  $A{f 0}={f 0}$ . The solution  ${f x}={f 0}$  called the trivial solution.

A non-trivial solution  ${f x}$  is a solution where at least one  $x_i$  is non-zero.

A, the following statements are logically equivalent (i.e. for any particular matrix A, they are all true or all false): Theorem 4: Existence of solutions to linear systems: For an  $m \times n$  matrix

a. For each  $\mathbf{b}$  in  $\mathbb{R}^m$ , the equation  $A\mathbf{x} = \mathbf{b}$  has a solution.

b. Each b in  $\mathbb{R}^m$  is a linear combination of the columns of A.

c. The columns of A span  $\mathbb{R}^m$  (i.e. Span  $\{\mathbf{a}_1,\mathbf{a}_2,\dots,\mathbf{a}_p\}=\mathbb{R}^m$ ) d. rref(A) has a pivot in every row.

Observe that  $\operatorname{rref}(A)$  has at most one pivot per column (condition 5 of a reduced  $\operatorname{rref}(A)$  cannot have a pivot in every row, so the statements above are all false. echelon form). So if A has more rows than columns (a "tall" matrix), then In particular, a set of fewer than m vectors cannot span  $\mathbb{R}^m$  HKBU Math 2207 Linear Algebra

If there are non-trivial solutions, what does the solution set look like?

**EXAMPLE**:

$$2x_1 + 4x_2 - 6x_3 = 0$$

$$4x_1 + 8x_2 - 10x_3 = 0$$

Corresponding augmented matrix:

$$\left[ \begin{array}{cc|c} 2 & 4 & -6 & 0 \\ 4 & 8 & -10 & 0 \\ \end{array} \right]$$
 Corresponding reduced echelon form:

$$\begin{bmatrix}
 1 & 2 & 0 & | & 0 \\
 0 & 0 & 1 & | & 0
 \end{bmatrix}$$

Solution set:

Geometric representation:

**EXAMPLE:** (same left hand side as before)

$$2x_1 + 4x_2 - 6x_3 = 0$$

$$4x_1 + 8x_2 - 10x_3 = 4$$

Corresponding augmented matrix:

$$\left[ \begin{array}{cc|c} 2 & 4 & -6 & 0 \\ 4 & 8 & -10 & 4 \end{array} \right]$$
 Corresponding reduced echelon form:

$$\begin{bmatrix}
 1 & 2 & 0 & | & 6 \\
 0 & 0 & 1 & | & 2
 \end{bmatrix}$$

Solution set:

Geometric representation:

**EXAMPLE:** Compare the solution sets of:

$$x_1 - 2x_2 - 2x_3 = 0 x_1 - 2x_2 - 2x_3 = 3$$

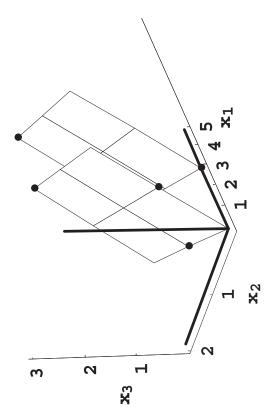

Corresponding augmented matrices:

$$\begin{bmatrix} 1 & -2 & -2 & 0 \end{bmatrix}$$

These are already in reduced echelon form.

Solution sets:

Geometric representation:

Parallel Solution Sets of Ax = 0 and Ax = b

In our first example:

- ullet The solution set of  $A\mathbf{x}=\mathbf{0}$  is a line through the origin parallel to  $\mathbf{v}$ .
  - The solution set of  $A\mathbf{x} = \mathbf{b}$  is a line through  $\mathbf{p}$  parallel to  $\mathbf{v}$ .

In our second example:

- ullet The solution set of  $A\mathbf{x}=\mathbf{0}$  is a plane through the origin parallel to  $\mathbf{u}$  and  $\mathbf{v}$ .
  - ullet The solution set of  $A\mathbf{x} = \mathbf{b}$  is a plane through  $\mathbf{p}$  parallel to  $\mathbf{u}$  and  $\mathbf{v}$ .

In both cases: to get the solution set of  $A\mathbf{x} = \mathbf{b}$ , start with the solution set of  $A\mathbf{x} = \mathbf{0}$  and translate it by  $\mathbf{p}$ .

 ${f p}$  is called a particular solution (one solution out of many).

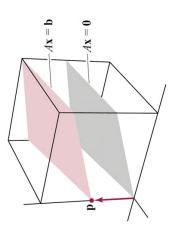

In general:

Theorem 6: Solutions and homogeneous equations: Suppose p is a solution to Ax = b. Then the solution set to Ax = b is the set of all vectors of the form  $w = p + v_h$ , where  $v_h$  is any solution of the homogeneous equation Ax = 0.

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 2, Page 27 of 43

Theorem 6: Solutions and homogeneous equations: Suppose  ${\bf p}$  is a solution to  $A{\bf x}={\bf b}$ . Then the solution set to  $A{\bf x}={\bf b}$  is the set of all vectors of the form  ${\bf w}={\bf p}+{\bf v}_{\bf h}$ , where  ${\bf v}_{\bf h}$  is any solution of the homogeneous equation  $A{\bf x}={\bf 0}$ .

Parallel solution sets of  $A\mathbf{x} = \mathbf{b}$  and  $A\mathbf{x} = \mathbf{0}$ .

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 2, Page 28 of 43

Theorem 6: Solutions and homogeneous equations: Suppose p is a solution to  $A\mathbf{x} = \mathbf{b}$ . Then the solution set to  $A\mathbf{x} = \mathbf{b}$  is the set of all vectors of the form  $w=p+v_h$  , where  $\mathbf{v_h}$  is any solution of the homogeneous equation  $A\mathbf{x}=\mathbf{0}.$ 

We show that  $\mathbf{w} = \mathbf{p} + \mathbf{v}_{\mathbf{h}}$  is a solution:

$$A(\mathbf{p} + \mathbf{v_h})$$

$$= A\mathbf{p} + A\mathbf{v_h}$$

$$= \mathbf{b} + \mathbf{0}$$

$$= \mathbf{b} + \mathbf{0}$$

We also need to show that all solutions are of the form  $\mathbf{w}=\mathbf{p}+\mathbf{v_h}$  - see q25 in Section 1.5 of the textbook.

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 2, Page 29 of 43

He: Let 
$$A = \begin{vmatrix} 1 & 1 & 1 \\ a_1 & a_2 & a_3 & a_4 \\ 1 & 1 & 1 \end{vmatrix} = \begin{bmatrix} 1 & 3 & 0 & -4 \\ 2 & 6 & 0 & -8 \end{bmatrix}$$
.

n Q2a, you found that the solution set to 
$$A\mathbf{x}=\mathbf{0}$$
 is  $\begin{vmatrix} 1 & 1 & 0 \\ 0 & 1 & 1 \end{vmatrix}$ 

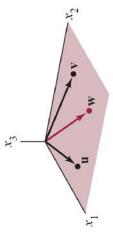

$$s,t$$
 can take any value.

In Q2b, you want to solve 
$$A\mathbf{x}=\begin{bmatrix} \mathbf{3} \\ 6 \end{bmatrix}$$
. Now  $\begin{bmatrix} \mathbf{3} \\ 6 \end{bmatrix}=0\mathbf{a}_1+1\mathbf{a}_2+0\mathbf{a}_3+0\mathbf{a}_4=A\begin{bmatrix} 1 \\ 0 \end{bmatrix}$ 

Notice that this solution looks different from the solution obtained from row-reduction: 3

But the solution sets are the same:

$$\begin{bmatrix} 3 \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} -3 \\ 1 \\ 0 \\ 0 \end{bmatrix} r + \begin{bmatrix} 0 \\ 1 \\ 1 \\ 0 \end{bmatrix} s + \begin{bmatrix} 0 \\ 0 \\ 1 \\ 0 \end{bmatrix} t = \begin{bmatrix} 3 \\ 0 \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} -3 \\ 1 \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} -3 \\ 1 \\ 0 \\ 0 \end{bmatrix} (r-1) + \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \end{bmatrix} t + \begin{bmatrix} 4 \\ 0 \\ 1 \\ 0 \end{bmatrix} t$$
 and  $r, s, t$  taking any value is equivalent to  $r-1, s, t$  taking any value.

In this picture, the plane is Span  $\{\mathbf{u},\mathbf{v},\mathbf{w}\}=$  Span  $\{\mathbf{u},\mathbf{v}\},$  so we do not need to include w to describe this plane.

We can think that  $\mathbf{w}$  is "too similar" to  $\mathbf{u}$  and  $\mathbf{v}$  - and linear dependence is the way to make this idea precise.

HKBU Math 2207 Linear Algebra

**Definition**: A set of vectors  $\{{\bf v_1},\dots,{\bf v_p}\}$  is *linearly independent* if the only solution to the vector equation

$$x_1\mathbf{v_1} + \dots + x_p\mathbf{v_p} = \mathbf{0}$$

is the trivial solution  $(x_1 = \cdots = x_p = 0)$ .

The opposite of linearly independent is linearly dependent:

**Definition**: A set of vectors  $\{\mathbf{v_1}, \dots, \mathbf{v_p}\}$  is *linearly dependent* if there are weights  $c_1, \dots, c_p$ , not all zero, such that

$$c_1\mathbf{v_1} + \dots + c_p\mathbf{v_p} = \mathbf{0}.$$

The equation  $c_1\mathbf{v_1}+\cdots+c_p\mathbf{v_p}=\mathbf{0}$  is a linear dependence relation.

HKBU Math 2207 Linear Algebra Semester 2 2017, Week 2, Page 32 of 43

Semester 2 2017, Week 2, Page 33 of 43

 $x_1 \mathbf{v_1} + \dots + x_p \mathbf{v_p} = \mathbf{0}$ 

The only solution is  $x_1=\cdots=x_p=0$ ightarrow linearly independent

**Example**: 
$$\left\{ \begin{bmatrix} 2\\1 \end{bmatrix}, \begin{bmatrix} 3\\0 \end{bmatrix} \right\}$$
 is linearly independent because

$$x_1 \begin{bmatrix} 2 \\ 1 \end{bmatrix} + x_2 \begin{bmatrix} 3 \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \Longrightarrow \begin{cases} 2x_1 + 3x_2 = 0 \\ x_1 \end{bmatrix} = 0$$

$$\begin{bmatrix} 1 \\ 1 \end{bmatrix} \quad \begin{bmatrix} 2 \\ 1 \end{bmatrix} \quad \begin{bmatrix} 0 \\ 1 \end{bmatrix} \quad \begin{bmatrix} 3 \\ 1 \end{bmatrix} \quad \begin{bmatrix} 3 \\ 1 \end{bmatrix}$$

There is a solution with some 
$$x_i \neq 0$$
  $\rightarrow$  linearly dependent

dependent because  $2 \begin{bmatrix} 2 \\ 1 \end{bmatrix} + (-1) \begin{bmatrix} 4 \\ 2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \, .$ Example:  $\left\{ \begin{bmatrix} 2\\1 \end{bmatrix}, \begin{bmatrix} 4\\2 \end{bmatrix} \right\}$  is linearly

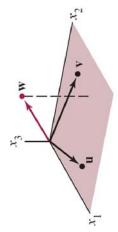

Semester 2 2017, Week 2, Page 34 of 43

HKBU Math 2207 Linear Algebra

 $x_1\mathbf{v_1} + \dots + x_p\mathbf{v_p} = \mathbf{0}$ 

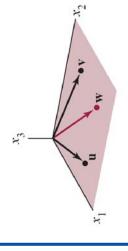

The only solution is  $x_1=\cdots=x_p=0$ (i.e. unique solution)

→ linearly independent

Informally:  $\mathbf{v}_1,\dots,\mathbf{v}_p$  are in "totally different directions"; there is "no relationship" between  $\mathbf{v}_1,\dots\mathbf{v}_p.$ HKBU Math 2207 Linear Algebra

There is a solution with some  $x_i \neq 0$ (i.e. infinitely many solutions) → linearly dependent

Informally:  $\mathbf{v}_1,\dots,\mathbf{v}_p$  are in "similar directions"

Semester 2 2017, Week 2, Page 35 of 43

Some easy cases:

$$(1)\mathbf{0} + (0)\mathbf{v_2} + \cdots + (0)\mathbf{v_p} = \mathbf{0}$$
 linearly dependent

Sets containing one vector {v}:

$$x\mathbf{v}=\mathbf{0} \qquad \text{linearly independent if } \mathbf{v}\neq 0$$
 
$$\begin{bmatrix} xv_1\\ \vdots\\ xv_n \end{bmatrix}=\begin{bmatrix} 0\\ \vdots\\ 0 \end{bmatrix}. \text{ If some } v_i\neq 0, \text{ then } x=0 \text{ is the only solution.}$$

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 2, Page 36 of 43

Some easy cases:

Sets containing two vectors {u, v}:

$$x_1\mathbf{u} + x_2\mathbf{v} = \mathbf{0}$$

if 
$$x_1 \neq 0$$
, then  ${\bf u} = (-x_2/x_1){\bf v}$ . if  $x_2 \neq 0$ , then  ${\bf v} = (-x_1/x_2){\bf u}$ .

So  $\{u,v\}$  is linearly dependent if and only if one of the vectors is a multiple of the other (see p34).

Sets containing more vectors:

$$x_1\mathbf{v_1} + \dots + x_p\mathbf{v_p} = \mathbf{0}$$

linear combination of the others. (If the weight  $x_i$  in the linear dependency A set of vectors is linearly dependent if and only if one of the vectors is a relation is non-zero, then  $\mathbf{v}_i$  is a linear combination of the other  $\mathbf{vs}.)$ 

How to determine if  $\langle \textbf{v}_1, \textbf{v}_2, ..., \textbf{v}_p \rangle$  is linearly independent:

**EXAMPLE** Let 
$$\mathbf{v}_1 = \begin{bmatrix} 1 \\ 3 \\ 5 \end{bmatrix}$$
,  $\mathbf{v}_2 = \begin{bmatrix} 2 \\ 5 \\ 9 \end{bmatrix}$ ,  $\mathbf{v}_3 = \begin{bmatrix} -3 \\ 9 \\ 3 \end{bmatrix}$ .

- a. Determine if  $\{v_1,v_2,v_3\}$  is linearly independent. b. If possible, find a linear dependence relation among  $v_1,v_2,v_3.$

$$\begin{bmatrix} 1 \\ 3 \\ 5 \end{bmatrix} + x_2 \begin{bmatrix} 2 \\ 5 \\ 9 \end{bmatrix} + x_3 \begin{bmatrix} -3 \\ 9 \\ 3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}.$$

Augmented matrix:

 $x_3$  is a free variable  $\Rightarrow$  there are nontrivial solutions.

 $\left\langle \textbf{v}_{1},\textbf{v}_{2},\textbf{v}_{3}\right\rangle$  is a linearly dependent set

(b) Reduced echelon form: 
$$\begin{bmatrix} 1 & 0 & 33 & 0 \\ 0 & 1 & -18 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

(any nonzero number). Then  $x_1 =$ 

$$\begin{bmatrix} 1 \\ 3 \\ 5 \end{bmatrix} + \begin{bmatrix} 2 \\ -1 \\ 9 \end{bmatrix} + \begin{bmatrix} -3 \\ -1 \\ 9 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$v_1 + v_2 + v_3 = 0$$

(one possible linear dependence relation)

A non-trivial solution to  $A\mathbf{x} = \mathbf{0}$  is a linear dependence relation between the columns of A:  $A\mathbf{x} = \mathbf{0}$  means  $x_1\mathbf{a}_1 + \cdots + x_n\mathbf{a}_n = \mathbf{0}$ .

For a matrix A, the Theorem: Uniqueness of solutions for linear systems: following are equivalent:

- a.  $A\mathbf{x} = \mathbf{0}$  has no non-trivial solution.
- b. If  $A\mathbf{x} = \mathbf{b}$  is consistent, then it has a unique solution.
- c. The columns of A are linearly independent. d. rref(A) has a pivot in every column (i.e. all variables are basic).

In particular: the row reduction algorithm produces at most one pivot in each row of  $\operatorname{rref}(A)$ . So, if A has more columns than  $\operatorname{rows}$  (a "fat"  $\operatorname{matrix}$ ), then  $\operatorname{rref}(A)$ cannot have a pivot in every column.

So a set of more than n vectors in  $\mathbb{R}^n$  is always linearly dependent.

Exercise: Combine this with the Theorem of Existence of Solutions (p19) to show that a set of n linearly independent vectors span  $\mathbb{R}^n$ 

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 2, Page 39 of 43

In problems about linear independence (or spanning) that do not involve specific numbers, it's often better not to compute, i.e. not to use row-reduction.

**Example**: Prove that, if  $\{2\mathbf{u}, \mathbf{v} + \mathbf{w}\}$  is linearly dependent, then  $\{\mathbf{u}, \mathbf{v}, \mathbf{w}\}$ linearly dependent.

 ${f Step~1}$  Rewrite the mathematical terms in the question as formulas. Be careful to distinguish what we know (first line of the proof) and what we want to show (last line of the proof)

What we know: there are scalars  $c_1, c_2$  not both zero such that

 $c_1(2\mathbf{u}) + c_2(\mathbf{v} + \mathbf{w}) = \mathbf{0}.$ 

What we want to show: there are scalars  $d_1,d_2,d_3$  not all zero such that

 $d_1\mathbf{u} + d_2\mathbf{v} + d_3\mathbf{w} = \mathbf{0}.$ 

statements, because the weights in different statements will in general be (Be careful to choose different letters for the weights in the different

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 2, Page 40 of 43

**Example**: Prove that, if  $\{2\mathbf{u}, \mathbf{v} + \mathbf{w}\}$  is linearly dependent, then  $\{\mathbf{u}, \mathbf{v}, \mathbf{w}\}$  is linearly dependent.

Step 1 Rewrite the mathematical terms in the question as formulas.

What we know: there are scalars  $c_1, c_2$  not both zero such that

 $c_1(2\mathbf{u}) + c_2(\mathbf{v} + \mathbf{w}) = \mathbf{0}.$ 

What we want to show: there are scalars  $d_1,d_2,d_3$  not all zero such that  $d_1\mathbf{u} + d_2\mathbf{v} + d_3\mathbf{w} = \mathbf{0}.$ 

Step 2 Fill in the missing steps by rearranging (and sometimes combining)

vector equations.

**Answer**: We know there are scalars 
$$c_1,c_2$$
 not both zero such that 
$$c_1(2{\bf u})+c_2({\bf v}+{\bf w})={\bf 0}$$

$$2c_1\mathbf{u} + c_2\mathbf{v} + c_2\mathbf{w} = \mathbf{0}$$

and  $2c_1, c_2, c_2$  are not all zero, so this is a linear dependence relation among

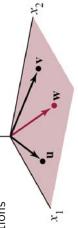

HKBU Math 2207 Linear Algebra

Semester 2 2017, Week 2, Page 41 of 43

## Partial summary of linear dependence:

The definition:  $x_1\mathbf{v_1}+\cdots+x_p\mathbf{v_p}=\mathbf{0}$  has a non-trivial solution (not all  $x_i$  are zero); equivalently, it has infinitely many solutions. Equivalently: one of the vectors is a linear combination of the others (see p33, also Theorem 7 in textbook). But it might not be the case that every vector in the set is a linear combination of the others (see Q2c on the exercise sheet).

Informal idea: the vectors are in "similar directions"

Semester 2 2017, Week 2, Page 42 of 43

Semester 2 2017, Week 2, Page 43 of 43

• Sets containing "too many" vectors (more than n vectors in  $\mathbb{R}^n$ );

Sets containing the zero vector;

Easy examples:

Partial summary of linear dependence (continued):

 $\left\{ \left| \frac{2}{1} \right|, \left| \frac{4}{2} \right| \right\}$  (this is the only possibility if the set • Multiples of vectors: e.g.  $\left. \left. \right. \right. \right.$ has two vectors);

• Other examples: e.g. <

Adding vectors to a linearly dependent set still makes a linearly dependent set (see Q2d on exercise sheet).

Equivalent: removing vectors from a linearly independent set still makes a linearly independent set (because P implies Q mean (not Q) implies (not P) - this is the contrapositive).
