- We have several ways to combine functions to make new functions: Addition: if f,g have the same domains and codomains, then we can set
  - $(f+g)\mathbf{x}=f(\mathbf{x})+g(\mathbf{x}),$  Composition: if the codomain of f is the domain of g, then we can set
- $(g\circ f){\bf x}=g(f({\bf x})),$  Inverse (§2.2): if f is one-to-one and onto, then we can set  $f^{-1}({\bf y})$  to be the unique solution to  $f(\mathbf{x}) = \mathbf{y}$ .

It turns out that the sum, composition and inverse of linear transformations are also linear, and we can ask how the standard matrix of the new function is related to the standard matrices of the old functions.

Notation:

The (i,j)-entry of a matirx A is the entry in row i, column j, and is written  $a_{ij}$  or  $(A)_{ij}.$ 

 $a_{13}$ 

 $a_{21}$ 

е В

The diagonal entries of A are the entries  $a_{11},a_{22},\ldots$ 

columns. The associated linear transformation has the A square matrix has the same number of rows as same domain and codomain. A diagonal matrix is square matrix whose nondiagonal entries are 0.

аў 69

The identity matrix  $I_n$  is the n imes n matrix whose diagonal It is the standard matrix for the identity transformation entries are 1 and whose nondiagonal entries are 0.  $T:\mathbb{R}^n \to \mathbb{R}^n$  given by  $T(\mathbf{x}) = \mathbf{x}$ .

e.g.  $I_3=$ 

Semester 1 2016, Week 5, Page 2 of 26

 $S,T:\mathbb{R}^n 
ightarrow \mathbb{R}^m$ , then what is A+B, the standard matrix of S+T? If A, B are the standard matrices for some linear transformations

Proceed column by column:

First column of the standard matrix of  $S+{\cal T}$ 

$$= (S + T)(\mathbf{e_1})$$

$$= S(\mathbf{e_1}) + T(\mathbf{e_1})$$

$$=$$
 first column of  $A$   $+$  first column of  $B$ 

i.e. 
$$(i, 1)$$
-entry of  $A + B = a_{i1} + b_{i1}$ .

The same is true of all the other columns, so  $(A+B)_{ij} = a_{ij} + b_{ij}$  .

0  $\begin{bmatrix} 1 & 1 \\ 5 & 7 \end{bmatrix}, \quad A+B = \begin{bmatrix} 5 & 1 \\ 2 & 8 \end{bmatrix}$  $\begin{bmatrix} 5 \\ 2 \end{bmatrix}, B = \begin{bmatrix} 1 & 1 \\ 3 & 5 \end{bmatrix}$ 0 % Example:  $A = \begin{bmatrix} 4 \\ -1 \end{bmatrix}$ 

HKBU Math 2207 Linear Algebra

Semester 1 2016, Week 5, Page 3 of 26

HKBU Math 2207 Linear Algebra

Scalar multiplication:

If A is the standard matrix for a linear transformation  $S:\mathbb{R}^n \to \mathbb{R}^m$ , and c is a scalar, then  $(cS)\mathbf{x} = c(S\mathbf{x})$  is a linear transformation. What is its standard  $\mathsf{matrix}\ cA?$ 

Proceed column by column:

First column of the standard matrix of cS $= (cS)(\mathbf{e_1})$ 

$$= (cs)(e_1)$$

$$=c(S\mathbf{e_1})$$

$$=$$
 first column of  $A$  multiplied by  $c$ .

i.e. 
$$(i,1)$$
-entry of  $cA$ = $ca_{i1}$ .

The same is true of all the other columns, so  $(cA)_{ij}=ca_{ij}.$ 

Example: 
$$A = \begin{bmatrix} 4 & 0 & 5 \\ -1 & 3 & 2 \end{bmatrix}, \quad c = -3, \quad cA = \begin{bmatrix} -12 & 0 & -15 \\ 3 & -9 & -6 \end{bmatrix}$$

Semester 1 2016, Week 5, Page 4 of 26

Addition and scalar multiplication satisfy some familiar rules of arithmetic:

Let A, B, and C be matrices of the same size, and let r and s be scalars. Then

**a.** 
$$A + B = B + A$$
 **d.**  $r(A + B) = rA + rB$ 

b. 
$$(A+B)+C=A+(B+C)$$
 e.  $(r+s)A=rA+sA$ 

**c**. 
$$A + 0 = A$$

$$\mathbf{f.} \ r(sA) = (rs)A$$

0 denotes the zero matrix:

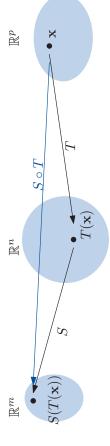

Semester 1 2016, Week 5, Page 5 of 26

HKBU Math 2207 Linear Algebra

### Composition:

and B is the standard matrix for a linear transformation  $T:\mathbb{R}^p o \mathbb{R}^n$ If A is the standard matrix for a linear transformation  $S:\mathbb{R}^n \to \mathbb{R}^m$ then the composition  $S \circ T$  (T first, then S) is linear.

What is its standard matrix AB?

A is a  $m \times n$  matrix,

B is a  $n \times p$  matrix,

AB is a  $m \times p$  matrix - so the (i,j)-entry of AB cannot simply be  $a_{ij}b_{ij}$ .

Semester 1 2016, Week 5, Page 6 of 26

HKBU Math 2207 Linear Algebra

 $AB=A\begin{bmatrix} b_1& & b_1\\ & & b_2\\ & & b_3\\ & & b_4\\ &$ 

The full column of 
$$AB$$
 is a linear continuation of the columns of  $A$  weights from the  $j$ th column of  $B$ .

**EXAMPLE:** Compute AB where  $A = \begin{bmatrix} 4 & -2 \\ 3 & -5 \end{bmatrix}$  and  $B = \begin{bmatrix} 2 & -3 \\ 6 & -7 \end{bmatrix}$ .

## Composition:

Proceed column by column:

First column of the standard matrix of  $S \circ T$ 

$$= (S \circ T)(\mathbf{e_1})$$

$$=S(T\mathbf{e_1})$$

 $=S(\mathbf{b_1})$ 

 $=A\mathbf{b_1}$ , and similarly for the other columns.

$$AB = A \begin{bmatrix} | & | & | \\ \mathbf{b}_1 & \cdots & \mathbf{b}_p \end{bmatrix} = \begin{bmatrix} | & | & | \\ A\mathbf{b}_1 & \cdots & A\mathbf{b}_p \end{bmatrix}.$$

So

The  $j {
m th}$  column of AB is a linear combination of the columns of A using weights from the  $j{\rm th}$  column of B.

$$(i,j)$$
-entry of  $AB$  is  $a_{i1}b_{1j}+a_{i2}b_{2j}+\cdots+a_{in}b_{nj}.$ 

Let A be  $m \times n$  and let B and C have sizes for which the indicated sums and products are defined (different sizes for each statement).

$$\mathbf{a}.A(BC) = (AB)C$$

b. 
$$A(B+C) = AB + AC$$
 (left - distributive law)  
c.  $(B+C)A = BA + CA$  (right-distributive law)

c. 
$$(B+C)A = BA + CA$$
  
d.  $r(AB) = (rA)B = A(rB)$ 

e. 
$$I_mA = A = AI_n$$

... but not all of them:

- Usually,  $AB \neq BA$ ,
- It is possible for AB = 0 even if  $A \neq 0$  and  $B \neq 0$ .

HKBU Math 2207 Linear Algebra

Semester 1 2016, Week 5, Page 9 of 26

Powers:

For a square matrix A, the kth power of A is  $A^k = \underbrace{A \dots A}_{}$ 

If A is the standard matrix for a linear transformation T, then  $A^k$  is the standard

matrix for 'applying  $T\ k$  times"

$$\begin{bmatrix} 3 & 0 \\ 0 & 2 \end{bmatrix}^3 = \begin{bmatrix} 3 & 0 \\ 0 & 2 \end{bmatrix} \left( \begin{bmatrix} 3 & 0 \\ 0 & 2 \end{bmatrix} \begin{bmatrix} 3 & 0 \\ 0 & 2 \end{bmatrix} \right) = \begin{bmatrix} 3 & 0 \\ 0 & 2 \end{bmatrix} \begin{bmatrix} 9 & 0 \\ 0 & 4 \end{bmatrix} = \begin{bmatrix} 27 & 0 \\ 0 & 8 \end{bmatrix}.$$

Exercise: show that  $\begin{bmatrix} a_{11} & 0 \\ 0 & a_{22} \end{bmatrix}^k = \begin{bmatrix} a_{11}^k & 0 \\ 0 & a_{22}^k \end{bmatrix}$ , and similarly for larger diagonal matrices.

HKBU Math 2207 Linear Algebra

Semester 1 2016, Week 5, Page 11 of 26

 $A=A^T$  (symmetric matrix, self-adjoint linear transformation), or  $A=-A^T$  (skew-symmetric matrix), or  $A^{-1}=A^T$  (orthogonal matrix, or isometric linear transformation).

Fun application of matrix multiplication:

Rotation through  $(\theta + \varphi) = (\text{rotation through } \theta) \circ (\text{rotation through } \varphi)$ . Consider rotations counterclockwise about the origin.

$$\begin{bmatrix} \cos(\theta + \varphi) & -\sin(\theta + \varphi) \end{bmatrix} = \begin{bmatrix} \cos(\theta) & -\sin(\theta) \end{bmatrix} \begin{bmatrix} \cos(\varphi) & -\sin(\varphi) \end{bmatrix} \begin{bmatrix} \sin(\varphi) & -\sin(\varphi) \end{bmatrix}$$

$$= \begin{bmatrix} \cos(\theta)\cos(\phi) - \sin(\theta)\sin(\phi) & -\cos(\theta)\sin(\phi) - \sin(\theta)\cos(\phi) \\ \sin(\theta)\cos(\phi) + \cos(\theta)\sin(\phi) & -\sin(\theta)\sin(\phi) + \cos(\theta)\cos(\phi) \end{bmatrix}.$$

So 
$$\cos(\theta + \varphi) = \cos(\theta)\cos(\varphi) - \sin(\theta)\sin(\varphi)$$
  
 $\sin(\theta + \varphi) = \cos(\theta)\sin(\varphi) + \sin(\theta)\cos(\varphi)$ 

HKBU Math 2207 Linear Algebra

Semester 1 2016, Week 5, Page 10 of 26

 $\mathbb{R}^m$ 

The transpose of A is the matrix  $A^T$ 

Transpose:

whose (i,j)-entry is  $a_{ji}$ . i.e. we obtain  $A^T$  by "flipping A

through the main diagonal".

$$\begin{bmatrix} 1 & 2 \\ 3 & 0 \end{bmatrix}^3 = \begin{bmatrix} 1 & 2 \\ 3 & 0 \end{bmatrix} \left( \begin{bmatrix} 1 & 2 \\ 3 & 0 \end{bmatrix} \begin{bmatrix} 1 & 2 \\ 3 & 0 \end{bmatrix} \right) = \begin{bmatrix} 1 & 2 \\ 3 & 0 \end{bmatrix} \begin{bmatrix} 7 & 2 \\ 3 & 6 \end{bmatrix} = \begin{bmatrix} 13 & 14 \\ 21 & 6 \end{bmatrix}.$$

$$\begin{bmatrix} 3 & 0 \\ 0 & 2 \end{bmatrix}^3 = \begin{bmatrix} 3 & 0 \\ 0 & 2 \end{bmatrix} \begin{pmatrix} \begin{bmatrix} 3 & 0 \\ 0 & 2 \end{bmatrix} \begin{bmatrix} 3 & 0 \\ 0 & 2 \end{bmatrix} \rangle = \begin{bmatrix} 3 & 0 \\ 0 & 2 \end{bmatrix} \begin{bmatrix} 9 & 0 \\ 0 & 4 \end{bmatrix} = \begin{bmatrix} 27 & 0 \\ 0 & 8 \end{bmatrix}.$$

We will be interested in square matrices A such that

Example:  $A = \begin{bmatrix} 4 & 0 & 5 \\ -1 & 3 & 2 \end{bmatrix}, \quad A^T = \begin{bmatrix} 1 & 0 & 3 \\ 5 & 2 \end{bmatrix}$ 

HKBU Math 2207 Linear Algebra

Semester 1 2016, Week 5, Page 12 of 26

Let A and B denote matrices whose sizes are appropriate for the following sums and products (different sizes for each statement).

- a.  $(A^T)^T = A$  (I.e., the transpose of  $A^T$  is A)
- b.  $(A+B)^T = A^T + B^T$
- d.  $(AB)^T = B^TA^T$  (i.e. the transpose of a product of matrices equals the product of their transposes in reverse order.

**Proof**: (i,j)-entry of  $(AB)^T=(j,i)$ -entry of AB

$$= a_{j1}b_{1i} + a_{j2}b_{2i} \cdots + a_{jn}b_{ni}$$

$$= (A^T)_{1j}(B^T)_{i1} + (A^T)_{2j}(B^T)_{i2} \cdots + (A^T)_{nj}(B^T)_{in}$$

$$= (i, j)\text{-entry of } B^TA^T.$$

HKBU Math 2207 Linear Algebra

 $\begin{bmatrix} \cdot \cdot \cdot \cdot \cdot \\ 0 & 0 \\ 0 \end{bmatrix}$ . HKBU Math 2207 Linear Algebra emester 1 2016, Week 5, Page 13 of 26

c. For any scalar r,  $(rA)^T = rA^T$ 

Equivalently,  $f^{-1}(y)$  is the unique solution to f(x)=y. So  $f^{-1}$  exists if and only if f is one-to-one and onto. Then we say f is invertible. function  $f^{-1}:C o D$  such that  $f^{-1}\circ f=$  identity map on D and  $f\circ f^{-1}=$ Let T be a linear transformation whose standard matrix is A. From last week: Remember from calculus that the inverse of a function  $f:D \to C$  is the ullet T is one-to-one if and only if  $\operatorname{rref}(A)$  has a pivot in every column. ullet T is onto if and only if rref(A) has a pivot in every row. §2.2: The Inverse of a Matrix identity map on C.

Semester 1 2016, Week 5, Page 14 of 26

Warning: not all square matrices come from invertible linear transformations,  $\begin{bmatrix} 1 & 0 \end{bmatrix}$ 

So if T is invertible, then A must be a square matrix.

function  $f^{-1}:C o D$  such that  $f^{-1}\circ f=$  identity map on D and  $f\circ f^{-1}=$ Remember from calculus that the inverse of a function  $f:D\to C$  is the identity map on C. **Definition**: A  $n \times n$  matrix A is invertible if there is a  $n \times n$  matrix C satisfying

Fact: A matrix C with this property is unique: if  $BA=AC=I_n$ , then  $BAC=BI_n=B$  and  $BAC=I_nC=C$  so B=C.

The matrix C is called the inverse of A, and is written  $A^{-1}$ . So

$$A^{-1}A = AA^{-1} = I_n.$$

A matrix that is not invertible is sometimes called singular.

function  $f^{-1}:C o D$  such that  $f^{-1}\circ f=$  identity map on D and  $f\circ f^{-1}=$ Remember from calculus that the inverse of a function  $f:D \to C$  is the dentity map on C.

Equivalently,  $f^{-1}(y)$  is the unique solution to f(x)=y.

Theorem 5: Solving linear systems with the inverse: If A is an invertible  $n \times n$ matrix, then, for each **b** in  $\mathbb{R}^n$ , the unique solution to  $A\mathbf{x} = \mathbf{b}$  is  $\mathbf{x} = A^{-1}\mathbf{b}$ .

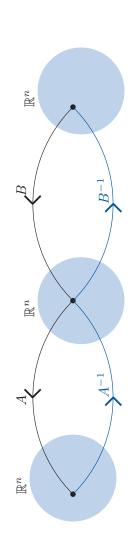

**Proof**: For any  $\mathbf{b}$  in  $\mathbb{R}^n$ , we have  $A(A^{-1}\mathbf{b}) = \mathbf{b}$ , so  $\mathbf{x} = A^{-1}\mathbf{b}$  is a solution.

And, if  ${\bf u}$  is any solution, then  ${\bf u}=A^{-1}(A{\bf u})=A^{-1}{\bf b}$ , so  $A^{-1}{\bf b}$  is the unique solution.

In particular, if A is an invertible n imes n matrix, then  $\operatorname{rref}(A) = I_n$ .

Suppose A and B are invertible. Then the following results hold:

- a.  $A^{-1}$  is invertible and  $(A^{-1})^{-1} = A$  (i.e. A is the inverse of  $A^{-1}$ ).
- b. AB is invertible and  $(AB)^{-1} = B^{-1}A^{-1}$
- c.  $A^T$  is invertible and  $(A^T)^{-1} = (A^{-1})^T$

HKBU Math 2207 Linear Algebra

HKBU Math 2207 Linear Algebra Semester 1 2016, Week 5, Page 17 of 26

Inverse of a  $2 \times 2$  matrix:

Fact: Let 
$$A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$$
.

- i) if  $ad-bc\ne 0$ , then A is invertible and  $A^{-1}=\frac{1}{ad-bc}\begin{bmatrix} d&-b\\-c&a \end{bmatrix}$ , if ad-bc=0, then A is not invertible,

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} \left( \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} \right) = \frac{1}{ad - bc} \begin{bmatrix} ad - bc & -ba + ab \\ cd - dc & -cb + da \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}.$$

$$\left( \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} \right) \begin{bmatrix} a & b \\ c & d \end{bmatrix} = \frac{1}{ad - bc} \begin{bmatrix} da - bc & bd - db \\ -ca + ac & -cb + ad \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}.$$

Proof of ii): next week.

Semester 1 2016, Week 5, Page 18 of 26

Inverse of a  $2 \times 2$  matrix:

**Example**: Let  $A = \begin{bmatrix} \cos(\varphi) & -\sin(\varphi) \\ \sin(\varphi) & \cos(\varphi) \end{bmatrix}$ , the standard matrix of rotation about the origin through an angle  $\phi$  counterclockwise.

 $\cos(\varphi)\cos(\varphi)-(-\sin(\varphi))\sin(\varphi)=\cos^2(\varphi)+\sin^2(\varphi)=1$  so A is invertible, and  $A^{-1} = \frac{1}{1} \begin{bmatrix} \cos(\phi) & \sin(\phi) \\ -\sin(\phi) & \cos(\phi) \end{bmatrix} = \begin{bmatrix} \cos(-\phi) & -\sin(-\phi) \\ \sin(-\phi) & \cos(-\phi) \end{bmatrix}, \text{ the standard matrix of rotation about the origin through an angle $\phi$ clockwise.}$ 

**Example**: Let  $B = \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}$ , the standard matrix of projection to the  $x_1$ -axis.

 $1 \cdot 0 - 0 \cdot 0 = 0$  so B is not invertible.

Exercise: choose a matrix  ${\cal C}$  that is the standard matrix of a reflection, and check that C is invertible and  $C^{-1} = C$ .

HKBU Math 2207 Linear Algebra

Inverse of a  $n \times n$  matrix:

If A is the standard matrix of an invertible linear transformation T, then  $A^{-1}$  is the standard matrix of  $T^{-1}$ . So

$$A^{-1} = \begin{bmatrix} & & & & & & & \\ & T^{-1}(\mathbf{e}_1) & \dots & & T^{-1}(\mathbf{e}_n) & & & \\ & & & & & & & \end{bmatrix}.$$

 $T^{-1}(\mathbf{e}_i)$  is the unique solution to the equation  $T(\mathbf{x})=\mathbf{e}_{\mathbf{i}}$ , or equivalently  $A\mathbf{x}=\mathbf{e}_{\mathbf{i}}$ . So if we row-reduce the augmented matrix  $[A|\mathbf{e}_{\mathbf{i}}]$ , we should get  $[I_n|T^{-1}(\mathbf{e}_i)]$ . (Remember  $\operatorname{rref}(A)=I_n$ .)

We carry out this row-reduction for all  $\mathbf{e}_i$  at the same time:

$$[A|I_n] = \begin{bmatrix} A & & & \\ e_1 & \dots & e_n \\ & & & \end{bmatrix} \xrightarrow{\text{row reduction}} \begin{bmatrix} I_n & & & \\ I_n & T^{-1}(e_1) & \dots & T^{-1}(e_n) \\ & & & & \end{bmatrix} = [I_n|A^{-1}].$$

HKBU Math 2207 Linear Algebra

Semester 1 2016, Week 5, Page 19 of 26

Semester 1 2016, Week 5, Page 20 of 26

 $[A|I_n]$  row reduction  $[I_n|A^{-1}]$ .  $\begin{bmatrix} 1 & 0 & 1 & 1 & 0 & 0 \\ 0 & 1 & 1 & -2 & 1 & 0 \\ 0 & 0 & 1 & -1/3 & 0 & 1/3 \end{bmatrix}$  $\begin{bmatrix} 1 & 0 & 1 & 1 & 0 & 0 \\ 0 & 1 & 1 & -2 & 1 & 0 \\ 0 & 0 & 3 & -1 & 0 & 1 \end{bmatrix}$  $\begin{bmatrix} 1 & 0 & 1 & 1 & 0 & 0 \\ 2 & 1 & 3 & 0 & 1 & 0 \\ 1 & 0 & 4 & 0 & 0 & 1 \end{bmatrix}$ **EXAMPLE**: Find the inverse of  $\begin{bmatrix} 1 & 0 & 1 \\ 2 & 1 & 3 \end{bmatrix}$ . If A is an invertible matrix, then

We showed that, if A is invertible, then  $[A|I_n]$  row-reduces to  $[I_n|A^{-1}]$ . The converse is also true: **Fact**: If  $[A|I_n]$  row-reduces to  $[I_n|C]$ , then A is invertible and  $C=A^{-1}$ .

If  $[A|I_n]$  row-reduces to  $[I_n|C]$ , then  ${f c}_i$  is the unique solution to  $A{f x}={f e}_i$ , so  $AC\mathbf{e}_i = A\mathbf{c}_i = \mathbf{e}_i$  for all i, so  $AC = I_n$ . Also  $[C|I_n]$  row-reduces to  $[I_n|A]$ . So  ${f a}_i$  is the unique solution to  $C{f x}={f e}_i$ , so  $CAe_i = Ca_i = e_i$  for all i, so  $CA = I_n$ .

In particular: an n imes n matrix A is invertible if and only if  $\operatorname{rref}(A) = I_n.$ 

 $\begin{bmatrix} 1 & 0 & 0 & 4/3 & 0 & -1/3 \\ 0 & 1 & 0 & -5/3 & 1 & -1/3 \\ 0 & 0 & 1 & -1/3 & 0 & 1/3 \end{bmatrix}$ 

Also equivalent:  $\mathsf{rref}(A)$  has a pivot in every row and column.

For a square matrix, having a pivot in each row is the same as having a pivot in each column.

HKBU Math 2207 Linear Algebra

Semester 1 2016, Week 5, Page 22 of 26

# §2.3: Characterisations of Invertible Matrices

For a square  $n \times n$  matrix A, the following are equivalent:

- A is invertible.
- $\operatorname{rref}(\mathsf{A}) = I_n$ .
- rref(A) has a pivot in every row.
- rref(A) has a pivot in every column.

# Theorem 8 (The Invertible Matrix Theorem)

Let A be a square  $n \times n$  matrix. The the following statements are equivalent (i.e., for a given A, they are either all true or all false).

- a. A is an invertible matrix
- b. A is row equivalent to I<sub>n</sub>.

c. A has n pivot positions.

- d. The equation Ax = 0 has only the trivial solution.
- e. The columns of A form a linearly independent set.
- f. The linear transformation x →Ax is one-to-one.
- g. The equation Ax = b has at least one solution for each b in  $R^n$

follows from ex. 1a

from Monday

- h. The columns of A span  $\mathbf{R}^n$
- The linear transformation x → Ax maps R" onto R"
- j. There is an  $n \times n$  matrix C such that  $CA = I_n$ .
- k. There is an  $n \times n$  matrix D such that  $AD = I_n$ .
- A<sup>T</sup> is an invertible matrix
- HKBU Math 2207 Linear Algebra

Semester 1 2016, Week 5, Page 23 of 26

ex. 1b from Monday

Important consequences:

• A set of n vectors in  $\mathbb{R}^n$  span  $\mathbb{R}^n$  if and only if the set is linearly independent (h  $\Leftrightarrow$  e).

• If A is a  $n \times n$  matrix and  $A\mathbf{x} = \mathbf{b}$  has a unique solution for some  $\mathbf{b}$ , then  $A\mathbf{x} = \mathbf{c}$  has a unique solution for all  $\mathbf{c}$  in  $\mathbb{R}^n$  ( $\sim \mathbf{d} \Longrightarrow \sim \mathbf{g}$ ).

• If A is a  $n \times n$  matrix and  $A\mathbf{x} = \mathbf{0}$  has a non-trivial solution, then there is a b in  $\mathbb{R}^n$  for which  $A\mathbf{x} = \mathbf{b}$  has no solution (not  $\mathbf{d} \implies$  not g).

• A linear transformation  $T:\mathbb{R}^n \to \mathbb{R}^n$  is one-to-one if and only if it is onto (f

Other applications:

Example: Is the matrix  $\begin{bmatrix} 1 & -1 & 4 \\ 2 & 0 & 8 \\ 3 & 8 & 12 \end{bmatrix}$  invertible?

Answer: No: the third column is 4 times the first column, so the columns are not linearly independent. So the matrix is not invertible (not e ==> not a).

HKBU Math 2207 Linear Algebra

Semester 1 2016, Week 5, Page 25 of 26

a. A is invertible  $\Leftrightarrow$  I.  $A^T$  is invertible. (Proof: Check that  $(A^T)^{-1} = (A^{-1})^T$ .)

This means that the statements in the Invertible Matrix Theorem are equivalent to the corresponding statements with "row" instead of "column", for example:

• The columns of an  $n \times n$  matrix are linearly independent if and only if its rows span  $\mathbb{R}^n$  (e  $\Leftrightarrow$  h<sup>T</sup>). (This is in fact also true for rectangular matrices.)

• If A is a square matrix and  $A\mathbf{x} = \mathbf{b}$  has a unique solution for some b, then the rows of A are linearly independent  $(\sim d \implies e^T)$ .

Advanced application (important for probability):

Let A be a square matrix. If the entries in each column of A sum to 1, then there is a vector  ${\bf v}$  such that  $A{\bf v}={\bf v}$ .

Hint: 
$$(A - I)^T$$
 :  $= 0$ .

HKBU Math 2207 Linear Algebra

Semester 1 2016, Week 5, Page 26 of 26
